As the prior on the weights is a Gaussian prior the histogram of the estimated weights is Gaussian

The estimation of the model is done by iteratively maximizing the marginal loglikelihood of the observations

We also plot predictions and uncertainties for Bayesian Ridge Regression for one dimensional regression using polynomial feature expansion Note the uncertainty starts going up on the right side of the plot This is because these test samples are outside of the range of the training samples

51831 Lasso model selection CrossValidation AIC BIC

Use the Akaike information criterion AIC the Bayes Information criterion BIC and crossvalidation to select an optimal value of the regularization parameter alpha of the Lasso estimator

Results obtained with LassoLarsIC are based on AICBIC criteria

Informationcriterion based model selection is very fast but it relies on a proper estimation of degrees of freedom are derived for large samples asymptotic results and assume the model is correct ie that the data are actually generated by this model They also tend to break when the problem is badly conditioned more features than samples

For crossvalidation we use 20fold with 2 algorithms to compute the Lasso path coordinate descent as implemented by the LassoCV class and Lars least angle regression as implemented by the LassoLarsCV class Both algorithms give roughly the same results They differ with regards to their execution speed and sources of numerical errors Lars computes a path solution only for each kink in the path As a result it is very efficient when there are only of few kinks which is the case if there are few features or samples Also it is able to compute the full path without setting any meta parameter On the opposite coordinate descent compute the path points on a prespecified grid here we use the default Thus it is more efficient if the number of grid points is smaller than the number of kinks in the path Such a strategy can be interesting if the number of features is really large and there are enough samples to select a large amount In terms of numerical errors for heavily correlated variables Lars will accumulate more errors while the coordinate descent algorithm will only sample the path on a grid

Note how the optimal value of alpha varies for each fold This illustrates why nestedcross validation is necessary when trying to evaluate the performance of a method for which a parameter is chosen by crossvalidation this choice of parameter may not be optimal for unseen data

51832 Multiclass sparse logisitic regression on newgroups20
Comparison of multinomial logistic L1 vs oneversusrest L1 logistic regression to classify documents from the new
groups20 dataset Multinomial logistic regression yields more accurate results and is faster to train on the larger scale
dataset
Here we use the l1 sparsity that trims the weights of not informative features to zero This is good if the goal is to
extract the strongly discriminative vocabulary of each class If the goal is to get the best predictive accuracy it is better
to use the non sparsityinducing l2 penalty instead
518 Generalized Linear Models 1207

scikitlearn user guide Release 0213

A more traditional and possibly better way to predict on a sparse subset of input features would be to use univariate feature selection followed by a traditional l2penalised logistic regression model

51833 Early stopping of Stochastic Gradient Descent

Stochastic Gradient Descent is an optimization technique which minimizes a loss function in a stochastic fashion performing a gradient descent step sample by sample. In particular, it is a very efficient method to fit linear models. As a stochastic method, the loss function is not necessarily decreasing at each iteration and convergence is only guaranteed in expectation. For this reason, monitoring the convergence on the loss function can be difficult. Another approach is to monitor convergence on a validation score. In this case, the input data is split into a training set and a validation set. The model is then fitted on the training set and the stopping criterion is based on the prediction score computed on the validation set. This enables us to find the least number of iterations which is sufficient to build a model that generalizes well to unseen data and reduces the chance of overfitting the training data. This early stopping strategy is activated if `earlystopping=True`; otherwise, the stopping criterion only uses the training loss on the entire input data. To better control the early stopping strategy, we can specify a parameter `validationfraction` which sets the fraction of the input dataset that we keep aside to compute the validation score. The optimization will continue until the validation score did not improve by at least `tol` during the last `niter` iterations. The actual number of iterations is available at the attribute `niter`. This example illustrates how the early stopping can be used in the `sklearn.linear_model.SGDClassifier` model to achieve almost the same accuracy as compared to a model built without early stopping. This can significantly reduce training time. Note that scores differ between the stopping criteria even from early iterations because some of the training data is held out with the validation stopping criterion.

5193 tSNE The effect of various perplexity values on the shape

An illustration of tSNE on the two concentric circles and the Scurve datasets for different perplexity values

We observe a tendency towards clearer shapes as the perplexity value increases

The size the distance and the shape of clusters may vary upon initialization perplexity values and does not always convey a meaning

As shown below tSNE for higher perplexities finds meaningful topology of two concentric circles however the size and the distance of the circles varies slightly from the original Contrary to the two circles dataset the shapes visually diverge from Scurve topology on the Scurve dataset even for larger perplexity values

For further details “How to Use tSNE Effectively” <https://distill.pub/2016/misreadtsne> provides a good discussion of the effects of various parameters as well as interactive plots to explore those effects

5195 Manifold Learning methods on a severed sphere

An application of the different Manifold learning techniques on a spherical dataset Here one can see the use of dimensionality reduction in order to gain some intuition regarding the manifold learning methods Regarding the dataset the poles are cut from the sphere as well as a thin slice down its side This enables the manifold learning techniques to ‘spread it open’ whilst projecting it onto two dimensions

For a similar example where the methods are applied to the Scurve dataset see [Comparison of Manifold Learning methods](#)

Note that the purpose of the MDS is to find a lowdimensional representation of the data here 2D in which the distances respect well the distances in the original highdimensional space unlike other manifoldlearning algorithms it does not seeks an isotropic representation of the data in the lowdimensional space Here the manifold problem matches fairly that of representing a flat map of the Earth as with map projection

5196 Manifold learning on handwritten digits Locally Linear Embedding
Isomap
An illustration of various embeddings on the digits dataset
1226 Chapter 5 Examples
```

scikitlearn user guide Release 0213

The RandomTreesEmbedding from the sklearnensemble module is not technically a manifold embedding method as it learn a highdimensional representation on which we apply a dimensionality reduction method However it is often useful to cast a dataset into a representation in which the classes are linearlyseparable

tSNE will be initialized with the embedding that is generated by PCA (Principal Component Analysis) in this example which is not the default setting

It ensures global stability of the embedding ie the embedding does not depend on random initialization

Linear Discriminant Analysis from the sklearniscriminantanalysis module and Neighborhood Components Analysis from the sklearnneighbors module are supervised dimensionality reduction method ie they make use of the provided labels contrary to other methods

5202 Gaussian Mixture Model Ellipsoids
Plot the confidence ellipsoids of a mixture of two Gaussians obtained with Expectation Maximisation
GaussianMixture class and Variational Inference BayesianGaussianMixture class models with a
Dirichlet process prior
Both models have access to five components with which to fit the data. Note that the Expectation Maximisation
model will necessarily use all five components while the Variational Inference model will effectively only use as many
as are needed for a good fit. Here we can see that the Expectation Maximisation model splits some components
arbitrarily because it is trying to fit too many components while the Dirichlet Process model adapts its number of state
automatically.
This example doesn't show it as we're in a low-dimensional space but another advantage of the Dirichlet process
model is that it can fit full covariance matrices effectively even when there are less examples per cluster than there are
dimensions in the data due to regularization properties of the inference algorithm.

5203 Gaussian Mixture Model Selection

This example shows that model selection can be performed with Gaussian Mixture Models using informationtheoretic

criteria BIC Model selection concerns both the covariance type and the number of components in the model In that

case AIC also provides the right result not shown to save time but BIC is better suited if the problem is to identify

the right model Unlike Bayesian procedures such inferences are priorfree

In that case the model with 2 components and full covariance which corresponds to the true generative model is

selected

5204 GMM covariances

Demonstration of several covariances types for Gaussian mixture models

SeeGaussian mixture models for more information on the estimator

Although GMM are often used for clustering we can compare the obtained clusters with the actual classes from the dataset We initialize the means of the Gaussians with the means of the classes from the training set to make this comparison valid

We plot predicted labels on both training and held out test data using a variety of GMM covariance types on the iris dataset We compare GMMs with spherical diagonal full and tied covariance matrices in increasing order of performance Although one would expect full covariance to perform best in general it is prone to overfitting on small datasets and does not generalize well to held out test data

On the plots train data is shown as dots while test data is shown as crosses The iris dataset is fourdimensional Only the first two dimensions are shown here and thus some points are separated in other dimensions

5205 Gaussian Mixture Model Sine Curve

This example demonstrates the behavior of Gaussian mixture models fit on data that was not sampled from a mixture of Gaussian random variables. The dataset is formed by 100 points loosely spaced following a noisy sine curve. There is therefore no ground truth value for the number of Gaussian components.

The first model is a classical Gaussian Mixture Model with 10 components fit with the ExpectationMaximization algorithm.

The second model is a Bayesian Gaussian Mixture Model with a Dirichlet process prior fit with variational inference.

The low value of the concentration prior makes the model favor a lower number of active components. This model “decides” to focus its modeling power on the big picture of the structure of the dataset: groups of points with alternating directions modeled by nondiagonal covariance matrices. Those alternating directions roughly capture the alternating nature of the original sine signal.

The third model is also a Bayesian Gaussian mixture model with a Dirichlet process prior, but this time the value of the concentration prior is higher, giving the model more liberty to model the fine-grained structure of the data. The result is a mixture with a larger number of active components that is similar to the first model where we arbitrarily decided to fix the number of components to 10.

scikitlearn user guide Release 0213

Which model is the best is a matter of subjective judgement do we want to favor models that only capture the big picture to summarize and explain most of the structure of the data while ignoring the details or do we prefer models that closely follow the high density regions of the signal

The last two panels show how we can sample from the last two models The resulting samples distributions do not look exactly like the original data distribution The difference primarily stems from the approximation error we made by using a model that assumes that the data was generated by a finite number of Gaussian components instead of a continuous noisy sine curve

5206 Concentration Prior Type Analysis of Variation Bayesian Gaussian Mixture

This example plots the ellipsoids obtained from a toy dataset mixture of three Gaussians fit

ted by the BayesianGaussianMixture class models with a Dirichlet distribution prior

weightconcentrationpriortypedirichletdistribution and a Dirichlet process

prior weightconcentrationpriortypedirichletprocess On each figure we plot the

results for three different values of the weight concentration prior

TheBayesianGaussianMixture class can adapt its number of mixture components automatically The param

eterweightconcentrationprior has a direct link with the resulting number of components with nonzero

weights Specifying a low value for the concentration prior will make the model put most of the weight on few com

ponents set the remaining components weights very close to zero High values of the concentration prior will allow a

larger number of components to be active in the mixture

The Dirichlet process prior allows to define an infinite number of components and automatically selects the correct

number of components it activates a component only if it is necessary

On the contrary the classical finite mixture model with a Dirichlet distribution prior will favor more uniformly weighted

components and therefore tends to divide natural clusters into unnecessary subcomponents

5212 Plotting Validation Curves

In this plot you can see the training scores and validation scores of an SVM (Support Vector Machine) for different values of the kernel parameter gamma For very low values of gamma you can see that both the training score and the validation score are low This is called underfitting Medium values of gamma will result in high values for both scores ie the classifier is performing fairly well If gamma is too high the classifier will overfit which means that the training score is good but the validation score is poor

```
printdoc
import matplotlib.pyplot as plt
import numpy as np
from sklearn.datasets import load_digits
from sklearn.svm import SVC (Support Vector Classification)
from sklearn.model_selection import validation_curve

5213 Underfitting vs Overfitting

This example demonstrates the problems of underfitting and overfitting and how we can use linear regression with polynomial features to approximate nonlinear functions The plot shows the function that we want to approximate which is a part of the cosine function In addition the samples from the real function and the approximations of different models are displayed The models have polynomial features of different degrees We can see that a linear function polynomial with degree 1 is not sufficient to fit the training samples This is called underfitting A polynomial of degree 4 approximates the true function almost perfectly However for higher degrees the model will overfit the training data ie it learns the noise of the training data We evaluate quantitatively overfitting underfitting by using crossvalidation We calculate the mean squared error MSE on the validation set the higher the less likely the model generalizes correctly from the training data

5214 Parameter estimation using grid search with crossvalidation

This examples shows how a classifier is optimized by crossvalidation which is done using the sklearn
modelselectionGridSearchCV object on a development set that comprises only half of the available labeled
data

The performance of the selected hyperparameters and trained model is then measured on a dedicated evaluation set
that was not used during the model selection step

More details on tools available for model selection can be found in the sections on Crossvalidation evaluating
estimator performance andTuning the hyperparameters of an estimator

5215 Train error vs Test error

Illustration of how the performance of an estimator on unseen data test data is not the same as the performance on training data As the regularization increases the performance on train decreases while the performance on test is optimal within a range of values of the regularization parameter The example with an ElasticNet regression model and the performance is measured using the explained variance aka R2

5216 Receiver Operating Characteristic ROC with cross validation

Example of Receiver Operating Characteristic ROC metric to evaluate classifier output quality using crossvalidation
ROC curves typically feature true positive rate on the Y axis and false positive rate on the X axis This means that the top left corner of the plot is the “ideal” point a false positive rate of zero and a true positive rate of one This is not very realistic but it does mean that a larger area under the curve AUC is usually better

The “steepness” of ROC curves is also important since it is ideal to maximize the true positive rate while minimizing the false positive rate

This example shows the ROC response of different datasets created from Kfold crossvalidation Taking all of these curves it is possible to calculate the mean area under curve and see the variance of the curve when the training set is split into different subsets This roughly shows how the classifier output is affected by changes in the training data and how different the splits generated by Kfold crossvalidation are from one another

Note
See also `sklearnmetricsrocaucscore` `sklearnmodelselectioncrossvalscore`

5217 Comparing randomized search and grid search for hyperparameter estimation
Compare randomized search and grid search for optimizing hyperparameters of a random forest All parameters that influence the learning are searched simultaneously except for the number of estimators which poses a time quality tradeoff
The randomized search and the grid search explore exactly the same space of parameters The result in parameter settings is quite similar while the run time for randomized search is drastically lower
The performance is slightly worse for the randomized search though this is most likely a noise effect and would not carry over to a heldout test set
Note that in practice one would not search over this many different parameters simultaneously using grid search but pick only the ones deemed most important

5218 Nested versus nonnested crossvalidation
This example compares nonnested and nested crossvalidation strategies on a classifier of the iris data set Nested
crossvalidation CV (Cross-Validation) is often used to train a model in which hyperparameters also need to be optimized Nested CV (Cross-Validation)
estimates the generalization error of the underlying model and its hyperparameter search Choosing the parameters
that maximize nonnested CV (Cross-Validation) biases the model to the dataset yielding an overlyoptimistic score
Model selection without nested CV (Cross-Validation) uses the same data to tune model parameters and evaluate model performance
Information may thus “leak” into the model and overfit the data The magnitude of this effect is primarily dependent
on the size of the dataset and the stability of the model See Cawley and Talbot1for an analysis of these issues
To avoid this problem nested CV (Cross-Validation) effectively uses a series of trainvalidationtest set splits In the inner loop
here executed by GridSearchCV the score is approximately maximized by fitting a model to each training
set and then directly maximized in selecting hyperparameters over the validation set In the outer loop here in
crossvalscore generalization error is estimated by averaging test set scores over several dataset splits
The example below uses a support vector classifier with a nonlinear kernel to build a model with optimized hyperpa
rameters by grid search We compare the performance of nonnested and nested CV (Cross-Validation) strategies by taking the difference
between their scores

5219 Demonstration of multimetric evaluation on cross-validation and Grid

SearchCV

Multiple metric parameter search can be done by setting the scoring parameter to a list of metric scorer names or a dict mapping the scorer names to the scorer callables

The scores of all the scorers are available in the cv_results dict at keys ending in scorer_name

mean_test_precision rank_test_precision etc

The best estimator, best_index, best_score and best_params correspond to the scorer key

that is set to the refit attribute

Author: Raghav RV, rvraghav93@gmail.com

import numpy as np

from matplotlib import pyplot as plt

from sklearn.datasets import make_hastie102

from sklearn.model_selection import GridSearchCV

from sklearn.metrics import make_scorer

from sklearn.metrics import accuracy_score

from sklearn.tree import DecisionTreeClassifier

print doc

Running GridSearchCV using multiple evaluation metrics

X, y = make_hastie102(n_samples=8000, random_state=42)

The scorers can be either be one of the predefined metric strings or a scorer callable like the one returned by make_scorer

scoring = AUC, roc_auc, Accuracy, make_scorer(accuracy_score)

Setting refit=AUC refits an estimator on the whole dataset with the parameter setting that has the best cross-validated AUC score

That estimator is made available at gs.best_estimator_ along with

parameters like gs.best_score_, gs.best_params_ and

gs.best_index_

gs = GridSearchCV(DecisionTreeClassifier(), random_state=42,

param_grid=dict(min_samples_split=range(2, 403, 10),

scoring=scoring, cv=5, refit=AUC, return_train_score=True)

52110 Balance model complexity and crossvalidated score

This example balances model complexity and crossvalidated score by finding a decent accuracy within 1 standard deviation of the best accuracy score while minimising the number of PCA (Principal Component Analysis) components 1

The figure shows the tradeoff between crossvalidated score and the number of PCA (Principal Component Analysis) components The balanced case is when ncomponents6 and accuracy080 which falls into the range within 1 standard deviation of the best accuracy score

52112 Confusion matrix
Example of confusion matrix usage to evaluate the quality of the output of a classifier on the iris data set The diagonal
elements represent the number of points for which the predicted label is equal to the true label while offdiagonal
elements are those that are mislabeled by the classifier The higher the diagonal values of the confusion matrix the
better indicating many correct predictions
The figures show the confusion matrix with and without normalization by class support size number of elements in
521 Model Selection 1285

scikitlearn user guide Release 0213
each class This kind of normalization can be interesting in case of class imbalance to have a more visual interpretation of which class is being misclassified
Here the results are not as good as they could be as our choice for the regularization parameter C was not the best In real life applications this parameter is usually chosen using Tuning the hyperparameters of an estimator

52113 Visualizing crossvalidation behavior in scikitlearn

Choosing the right crossvalidation object is a crucial part of fitting a model properly There are many ways to split data into training and test sets in order to avoid model overfitting to standardize the number of groups in test sets etc This example visualizes the behavior of several common scikitlearn objects for comparison

```
from sklearn.model_selection import TimeSeriesSplit KFold ShuffleSplit
StratifiedKFold GroupShuffleSplit
GroupKFold StratifiedShuffleSplit
import numpy as np
import matplotlib.pyplot as plt
from matplotlib.patches import Patch
np.random.seed(1338)
cmapdata plt.cm.Paired
cmapcv plt.cm.coolwarm
nsplits 4
```

Visualize our data

First we must understand the structure of our data It has 100 randomly generated input datapoints 3 classes split unevenly across datapoints and 10 “groups” split evenly across datapoints As we’ll see some crossvalidation objects do specific things with labeled data others behave differently with grouped data and others do not use this information To begin we’ll visualize our data

521 Model Selection 1289

returnax

Let's see how it looks for the KFold crossvalidation object

fig ax pltsubplots

cv KFoldnsplits

plotcvindicescv X y groups ax nsplits

521 Model Selection 1291

scikitlearn user guide Release 0.21.3

As you can see by default the KFold crossvalidation iterator does not take either datapoint class or group into consideration We can change this by using the StratifiedKFold like so

```
fig, ax = plt.subplots()
cv = StratifiedKFold(n_splits=5)
plot_cv_indices(cv, X, y, groups=ax, nsplits=5)
```

scikitlearn user guide Release 0213

In this case the crossvalidation retained the same ratio of classes across each CV (Cross-Validation) split Next we'll visualize this behavior for a number of CV (Cross-Validation) iterators

Visualize crossvalidation indices for many CV (Cross-Validation) objects

Let's visually compare the cross validation behavior for many scikitlearn crossvalidation objects Below we will loop through several common crossvalidation objects visualizing the behavior of each

Note how some use the groupclass information while others do not

52114 Receiver Operating Characteristic ROC

Example of Receiver Operating Characteristic ROC metric to evaluate classifier output quality

ROC curves typically feature true positive rate on the Y axis and false positive rate on the X axis This means that the top left corner of the plot is the “ideal” point a false positive rate of zero and a true positive rate of one This is not very realistic but it does mean that a larger area under the curve AUC is usually better

The “steepness” of ROC curves is also important since it is ideal to maximize the true positive rate while minimizing the false positive rate

Multiclass settings

ROC curves are typically used in binary classification to study the output of a classifier In order to extend ROC curve and ROC area to multiclass or multilabel classification it is necessary to binarize the output One ROC curve can be drawn per label but one can also draw a ROC curve by considering each element of the label indicator matrix as a binary prediction microaveraging

Another evaluation measure for multiclass classification is macroaveraging which gives equal weight to the classification of each label

52115 Plotting Learning Curves

On the left side the learning curve of a naive Bayes classifier is shown for the digits dataset Note that the training score and the crossvalidation score are both not very good at the end However the shape of the curve can be found in more complex datasets very often the training score is very high at the beginning and decreases and the cross validation score is very low at the beginning and increases On the right side we see the learning curve of an SVM (Support Vector Machine) with RBF (Radial Basis Function) kernel We can see clearly that the training score is still around the maximum and the validation score could be increased with more training samples

Generate a simple plot of the test and training learning curve
Parameters

estimator object type that implements the fit and predict methods
An object of that type which is cloned for each validation
title string
Title for the chart
X arraylike shape nsamples nfeatures
Training vector where nsamples is the number of samples and
nfeatures is the number of features
1302 Chapter 5 Examples

scikitlearn user guide Release 0213

y arraylike shape nsamples or nsamples nfeatures optional
Target relative to X for classification or regression
None for unsupervised learning

ylim tuple shape ymin ymax optional
Defines minimum and maximum yvalues plotted

cv int crossvalidation generator or an iterable optional
Determines the crossvalidation splitting strategy
Possible inputs for cv are
None to use the default 3fold crossvalidation
integer to specify the number of folds
termCV splitter
An iterable yielding train test splits as arrays of indices
For integerNone inputs if y is binary or multiclass
classStratifiedKFold used If the estimator is not a classifier
or if y is neither binary nor multiclass classKFold is used
Refer refUser Guide crossvalidation for the various
crossvalidators that can be used here

njobs int or None optional defaultNone
Number of jobs to run in parallel
None means 1 unless in a objjoblibparallelbackend context
1 means using all processors See termGlossary njobs
for more details

trainsizes arraylike shape nticks dtype float or int
Relative or absolute numbers of training examples that will be used to
generate the learning curve If the dtype is float it is regarded as a
fraction of the maximum size of the training set that is determined
by the selected validation method ie it has to be within 0 1
Otherwise it is interpreted as absolute sizes of the training sets
Note that for classification the number of samples usually have to
be big enough to contain at least one sample from each class

52116 PrecisionRecall

Example of PrecisionRecall metric to evaluate classifier output quality

PrecisionRecall is a useful measure of success of prediction when the classes are very imbalanced. In information

retrieval, precision is a measure of result relevancy while recall is a measure of how many truly relevant results are

returned.

The precision-recall curve shows the tradeoff between precision and recall for different thresholds. A high area under

the curve represents both high recall and high precision, where high precision relates to a low false positive rate and

high recall relates to a low false negative rate. High scores for both show that the classifier is returning accurate results.

High precision as well as returning a majority of all positive results (high recall).

A system with high recall but low precision returns many results but most of its predicted labels are incorrect when

compared to the training labels. A system with high precision but low recall is just the opposite, returning very few

results but most of its predicted labels are correct when compared to the training labels. An ideal system with high

precision and high recall will return many results with all results labeled correctly.

Precision is defined as the number of true positives over the number of true positives plus the number of false

positives.

1304

Chapter 5

Examples

Recall $\frac{TP}{TP+FN}$ is defined as the number of true positives TP over the number of true positives plus the number of false negatives FN

$\frac{TP}{TP+FN}$
 $\frac{TP}{TP+FN}$

These quantities are also related to the F_1 score which is defined as the harmonic mean of precision and recall

$F_1 = 2 \times \frac{precision \times recall}{precision + recall}$
 F_1

Note that the precision may not decrease with recall The definition of precision $\frac{TP}{TP+FP}$

$\frac{TP}{TP+FP}$ shows that lowering the threshold of a classifier may increase the denominator by increasing the number of results returned If the threshold was previously set too high the new results may all be true positives which will increase precision If the previous threshold was about right or too low further lowering the threshold will introduce false positives decreasing precision Recall is defined as $\frac{TP}{TP+FN}$

$\frac{TP}{TP+FN}$ where FN does not depend on the classifier threshold This means that lowering the classifier threshold may increase recall by increasing the number of true positive results It is also possible that lowering the threshold may leave recall unchanged while the precision fluctuates The relationship between recall and precision can be observed in the stairstep area of the plot at the edges of these steps a small change in the threshold considerably reduces precision with only a minor gain in recall Average precision AP summarizes such a plot as the weighted mean of precisions achieved at each threshold with the increase in recall from the previous threshold used as the weight

$AP = \sum_{i=1}^n \frac{precision_i \times (recall_i - recall_{i-1})}{recall_i - recall_{i-1}}$

$precision_i \times (recall_i - recall_{i-1})$ where $precision_i$ and $recall_i$ are the precision and recall at the i th threshold A pair $(precision_i, recall_i)$ is referred to as an operating point AP and the trapezoidal area under the operating points `sklearn.metrics.auc` are common ways to summarize a precisionrecall curve that lead to different results Read more in the User Guide

Precisionrecall curves are typically used in binary classification to study the output of a classifier In order to extend the precisionrecall curve and average precision to multiclass or multilabel classification it is necessary to binarize the output One curve can be drawn per label but one can also draw a precisionrecall curve by considering each element of the label indicator matrix as a binary prediction microaveraging

5221 Classifier Chain

Example of using classifier chain on a multilabel dataset

For this example we will use the yeast dataset which contains 2417 datapoints each with 103 features and 14 possible labels Each data point has at least one label As a baseline we first train a logistic regression classifier for each of the 14 labels To evaluate the performance of these classifiers we predict on a heldout test set and calculate the jaccard score for each sample

Next we create 10 classifier chains Each classifier chain contains a logistic regression model for each of the 14 labels

The models in each chain are ordered randomly In addition to the 103 features in the dataset each model gets the predictions of the preceding models in the chain as features note that by default at training time each model gets the true labels as features These additional features allow each chain to exploit correlations among the classes The Jaccard similarity score for each chain tends to be greater than that of the set independent logistic models

Because the models in each chain are arranged randomly there is significant variation in performance among the chains Presumably there is an optimal ordering of the classes in a chain that will yield the best performance However we do not know that ordering a priori Instead we can construct an voting ensemble of classifier chains by averaging the binary predictions of the chains and apply a threshold of 05 The Jaccard similarity score of the ensemble is greater than that of the independent models and tends to exceed the score of each chain in the ensemble although this is not guaranteed with randomly ordered chains

5.2.3.2 Outlier detection with Local Outlier Factor (LOF)
The Local Outlier Factor (LOF) algorithm is an unsupervised anomaly detection method which computes the local density deviation of a given data point with respect to its neighbors. It considers as outliers the samples that have a substantially lower density than their neighbors. This example shows how to use LOF for outlier detection which is the default use case of this estimator in scikitlearn. Note that when LOF is used for outlier detection it has no predict, decision_function and score_samples methods. See User Guide for details on the difference between outlier detection and novelty detection and how to use LOF for novelty detection.
The number of neighbors considered parameter n_neighbors is typically set 1 greater than the minimum number of samples a cluster has to contain so that other samples can be local outliers relative to this cluster and 2 smaller than the maximum number of close by samples that can potentially be local outliers. In practice such informations are generally not available and taking n_neighbors=20 appears to work well in general.

5236 Novelty detection with Local Outlier Factor LOF

The Local Outlier Factor LOF algorithm is an unsupervised anomaly detection method which computes the local density deviation of a given data point with respect to its neighbors It considers as outliers the samples that have a substantially lower density than their neighbors This example shows how to use LOF for novelty detection Note that when LOF is used for novelty detection you MUST not use predict decisionfunction and scoresamples on the training set as this would lead to wrong results You must only use these methods on new unseen data which are not in the training set See User Guide for details on the difference between outlier detection and novelty detection and how to use LOF for outlier detection

The number of neighbors considered parameter nneighbors is typically set 1 greater than the minimum number of samples a cluster has to contain so that other samples can be local outliers relative to this cluster and 2 smaller than the maximum number of close by samples that can potentially be local outliers In practice such informations are generally not available and taking nneighbors20 appears to work well in general

```

5238 Dimensionality Reduction with Neighborhood Components Analysis

Sample usage of Neighborhood Components Analysis for dimensionality reduction

This example compares different linear dimensionality reduction methods applied on the Digits data set The data

523 Nearest Neighbors 1331

scikitlearn user guide Release 0213

set contains images of digits from 0 to 9 with approximately 180 samples of each class Each image is of dimension 8x8 64 and is reduced to a twodimensional data point

Principal Component Analysis PCA (Principal Component Analysis) applied to this data identifies the combination of attributes principal components or directions in the feature space that account for the most variance in the data Here we plot the different samples on the 2 first principal components

Linear Discriminant Analysis LDA tries to identify attributes that account for the most variance between classes In particular LDA in contrast to PCA (Principal Component Analysis) is a supervised method using known class labels

Neighborhood Components Analysis NCA tries to find a feature space such that a stochastic nearest neighbor algorithm will give the best accuracy Like LDA it is a supervised method

One can see that NCA enforces a clustering of the data that is visually meaningful despite the large reduction in dimension

5239 Kernel Density Estimate of Species Distributions
This shows an example of a neighborsbased query in particular a kernel density estimate on geospatial data using
a Ball Tree built upon the Haversine distance metric - ie distances over points in latitudelongitude The dataset
523 Nearest Neighbors 1335
```

scikitlearn user guide Release 0213

is provided by Phillips et al 2006 If available the example uses basemap to plot the coast lines and national boundaries of South America

This example does not perform any learning over the data see Species distribution modeling for an example of classification based on the attributes in this dataset It simply shows the kernel density estimate of observed data points in geospatial coordinates

The two species are

- “Bradypus variegatus” the Brownthroated Sloth
- “Microryzomys minutus” also known as the Forest Small Rice Rat a rodent that lives in Peru Colombia Ecuador Peru and Venezuela

52311 Simple 1D Kernel Density Estimation

This example uses the `sklearn.neighbors.KernelDensity` class to demonstrate the principles of Kernel Density Estimation in one dimension

The first plot shows one of the problems with using histograms to visualize the density of points in 1D Intuitively a histogram can be thought of as a scheme in which a unit “block” is stacked above each point on a regular grid As the top two panels show however the choice of gridding for these blocks can lead to wildly divergent ideas about the underlying shape of the density distribution If we instead center each block on the point it represents we get the estimate shown in the bottom left panel This is a kernel density estimation with a “top hat” kernel This idea can be generalized to other kernel shapes the bottomright panel of the first figure shows a Gaussian kernel density estimate over the same distribution

Scikitlearn implements efficient kernel density estimation using either a Ball Tree or KD Tree structure through the `sklearn.neighbors.KernelDensity` estimator The available kernels are shown in the second figure of this example

The third figure compares kernel density estimates for a distribution of 100 samples in 1 dimension Though this example uses 1D distributions kernel density estimation is easily and efficiently extensible to higher dimensions as well

5241 Visualization of MLP weights on MNIST
Sometimes looking at the learned coefficients of a neural network can provide insight into the learning behavior. For example, if weights look unstructured, maybe some were not used at all, or if very large coefficients exist, maybe regularization was too low or the learning rate too high.
524 Neural Networks 1347

scikitlearn user guide Release 0213

This example shows how to plot some of the first layer weights in a MLPClassifier trained on the MNIST dataset. The input data consists of 28x28 pixel handwritten digits leading to 784 features in the dataset. Therefore the first layer weight matrix have the shape 784 hiddenlayersizes0. We can therefore visualize a single column of the weight matrix as a 28x28 pixel image. To make the example run faster we use very few hidden units and train only for a very short time. Training longer would result in weights with a much smoother spatial appearance.

5242 Restricted Boltzmann Machine features for digit classification
For greyscale image data where pixel values can be interpreted as degrees of blackness on a white background like
handwritten digit recognition the Bernoulli Restricted Boltzmann machine model BernoulliRBM can perform
effective nonlinear feature extraction
In order to learn good latent representations from a small dataset we artificially generate more labeled data by per-
turbating the training data with linear shifts of 1 pixel in each direction
This example shows how to build a classification pipeline with a BernoulliRBM feature extractor and a
LogisticRegression classifier. The hyperparameters of the entire model (learning rate, hidden layer size, regu-
larization) were optimized by grid search but the search is not reproduced here because of runtime constraints.
Logistic regression on raw pixel values is presented for comparison. The example shows that the features extracted by
the BernoulliRBM help improve the classification accuracy.

5243 Varying regularization in Multilayer Perceptron

A comparison of different values for regularization parameter ‘alpha’ on synthetic datasets The plot shows that different alphas yield different decision functions

Alpha is a parameter for regularization term aka penalty term that combats overfitting by constraining the size of the weights Increasing alpha may fix high variance a sign of overfitting by encouraging smaller weights resulting in a decision boundary plot that appears with lesser curvatures Similarly decreasing alpha may fix high bias a sign of underfitting by encouraging larger weights potentially resulting in a more complicated decision boundary

5244 Compare Stochastic learning strategies for MLPClassifier
This example visualizes some training loss curves for different stochastic learning strategies including SGD and Adam. Because of time constraints we use several small datasets for which LBFGS might be more suitable. The general trend shown in these examples seems to carry over to larger datasets, however.
Note that those results can be highly dependent on the value of learning_rate/init.

5252 Using KBinsDiscretizer to discretize continuous features
The example compares prediction result of linear regression linear model and decision tree tree based model with and without discretization of realvalued features
As is shown in the result before discretization linear model is fast to build and relatively straightforward to interpret but can only model linear relationships while decision tree can build a much more complex model of the data One way to make linear model more powerful on continuous data is to use discretization also known as binning In the example we discretize the feature and onehot encode the transformed data Note that if the bins are not reasonably wide there would appear to be a substantially increased risk of overfitting so the discretizer parameters should usually be tuned under cross validation
After discretization linear regression and decision tree make exactly the same prediction As features are constant within each bin any model must predict the same value for all points within a bin Compared with the result before
1362 Chapter 5 Examples

scikitlearn user guide Release 0213

discretization linear model become much more flexible while decision tree gets much less flexible Note that binning features generally has no beneficial effect for treebased models as these models can learn to split up the data anywhere

5253 Demonstrating the different strategies of KBinsDiscretizer

This example presents the different strategies implemented in KBinsDiscretizer

- ‘uniform’ The discretization is uniform in each feature which means that the bin widths are constant in each dimension
- ‘quantile’ The discretization is done on the quantiled values which means that each bin has approximately the same number of samples
- ‘kmeans’ The discretization is based on the centroids of a KMeans clustering procedure

The plot shows the regions where the discretized encoding is constant

scikitlearn user guide Release 0213

5254 Importance of Feature Scaling

Feature scaling through standardization or Zscore normalization can be an important preprocessing step for many machine learning algorithms Standardization involves rescaling the features such that they have the properties of a standard normal distribution with a mean of zero and a standard deviation of one

While many algorithms such as SVM (Support Vector Machine) Knearest neighbors and logistic regression require features to be normalized intuitively we can think of Principle Component Analysis PCA (Principal Component Analysis) as being a prime example of when normalization is important In PCA (Principal Component Analysis) we are interested in the components that maximize the variance If one component eg human height varies less than another eg weight because of their respective scales meters vs kilos PCA (Principal Component Analysis) might determine that the direction of maximal variance more closely corresponds with the 'weight' axis if those features are not scaled As a change in height of one meter can be considered much more important than the change in weight of one kilogram this is clearly incorrect

To illustrate this PCA (Principal Component Analysis) is performed comparing the use of data with StandardScaler applied to unscaled data The results are visualized and a clear difference noted The 1st principal component in the unscaled set can be seen It can be seen that feature 13 dominates the direction being a whole two orders of magnitude above the other features This is contrasted when observing the principal component for the scaled version of the data In the scaled version the orders of magnitude are roughly the same across all the features

The dataset used is the Wine Dataset available at UCI This dataset has continuous features that are heterogeneous in scale due to differing properties that they measure ie alcohol content and malic acid

The transformed data is then used to train a naive Bayes classifier and a clear difference in prediction accuracies is observed wherein the dataset which is scaled before PCA (Principal Component Analysis) vastly outperforms the unscaled version

5255 Map data to a normal distribution

This example demonstrates the use of the BoxCox and YeoJohnson transforms through preprocessing

PowerTransformer to map data from various distributions to a normal distribution

The power transform is useful as a transformation in modeling problems where homoscedasticity and normality are de

sired Below are examples of BoxCox and YeoJohnwon applied to six different probability distributions Lognormal

Chisquared Weibull Gaussian Uniform and Bimodal

Note that the transformations successfully map the data to a normal distribution when applied to certain datasets but

are ineffective with others This highlights the importance of visualizing the data before and after transformation

Also note that even though BoxCox seems to perform better than YeoJohnson for lognormal and chisquared distri

butions keep in mind that BoxCox does not support inputs with negative values

For comparison we also add the output from preprocessingQuantileTransformer It can force any ar

bitrary distribution into a gaussian provided that there are enough training samples thousands Because it is a

nonparametric method it is harder to interpret than the parametric ones BoxCox and YeoJohnson

On “small” datasets less than a few hundred points the quantile transformer is prone to overfitting The use of the

power transform is then recommended

5256 Feature discretization
A demonstration of feature discretization on synthetic classification datasets Feature discretization decomposes each
feature into a set of bins here equally distributed in width The discrete values are then onehot encoded and given to
a linear classifier This preprocessing enables a nonlinear behavior even though the classifier is linear
525 Preprocessing 1373
```

scikitlearn user guide Release 0213

On this example the first two rows represent linearly nonseparable datasets moons and concentric circles while the third is approximately linearly separable On the two linearly nonseparable datasets feature discretization largely increases the performance of linear classifiers On the linearly separable dataset feature discretization decreases the performance of linear classifiers Two nonlinear classifiers are also shown for comparison This example should be taken with a grain of salt as the intuition conveyed does not necessarily carry over to real datasets Particularly in highdimensional spaces data can more easily be separated linearly Moreover using feature discretization and onehot encoding increases the number of features which easily lead to overfitting when the number of samples is small The plots show training points in solid colors and testing points semitransparent The lower right shows the classification accuracy on the test set

5257 Compare the effect of different scalers on data with outliers

Feature 0 median income in a block and feature 5 number of households of the California housing dataset have very different scales and contain some very large outliers These two characteristics lead to difficulties to visualize the data and more importantly they can degrade the predictive performance of many machine learning algorithms Unscaled data can also slow down or even prevent the convergence of many gradientbased estimators Indeed many estimators are designed with the assumption that each feature takes values close to zero or more importantly that all features vary on comparable scales In particular metricbased and gradientbased estimators often assume approximately standardized data centered features with unit variances A notable exception are decision treebased estimators that are robust to arbitrary scaling of the data

This example uses different scalers transformers and normalizers to bring the data within a predefined range Scalers are linear or more precisely affine transformers and differ from each other in the way to estimate the parameters used to shift and scale each feature

QuantileTransformer provides nonlinear transformations in which distances between marginal outliers and inliers are shrunk PowerTransformer provides nonlinear transformations in which data is mapped to a normal distribution to stabilize variance and minimize skewness

Unlike the previous transformations normalization refers to a per sample transformation instead of a per feature transformation

The following code is a bit verbose feel free to jump directly to the analysis of the results

labelColor mapping for values of y

Original data

Each transformation is plotted showing two transformed features with the left plot showing the entire dataset and the right zoomedin to show the dataset without the marginal outliers A large majority of the samples are compacted to a specific range 0 10 for the median income and 0 6 for the number of households Note that there are some marginal outliers some blocks have more than 1200 households Therefore a specific preprocessing can be very beneficial depending of the application In the following we present some insights and behaviors of those preprocessing methods in the presence of marginal outliers

makeplot0
525 Preprocessing 1381

StandardScaler

StandardScaler removes the mean and scales the data to unit variance. However, the outliers have an influence when computing the empirical mean and standard deviation, which shrink the range of the feature values as shown in the left figure below. Note in particular that because the outliers on each feature have different magnitudes, the spread of the transformed data on each feature is very different: most of the data lie in the $[-2, 4]$ range for the transformed median income feature, while the same data is squeezed in the smaller $[-0.2, 0.2]$ range for the transformed number of households.

StandardScaler therefore cannot guarantee balanced feature scales in the presence of outliers.

makeplot1

MinMaxScaler

MinMaxScaler rescales the data set such that all feature values are in the range $[0, 1]$ as shown in the right panel below. However, this scaling compresses all inliers in the narrow range $[0, 0.005]$ for the transformed number of households.

AsStandardScaler MinMaxScaler is very sensitive to the presence of outliers.

makeplot2

MaxAbsScaler

MaxAbsScaler differs from the previous scaler such that the absolute values are mapped in the range 0 1 On positive only data this scaler behaves similarly to MinMaxScaler and therefore also suffers from the presence of large outliers

makeplot3

RobustScaler

Unlike the previous scalers the centering and scaling statistics of this scaler are based on percentiles and are therefore not influenced by a few number of very large marginal outliers Consequently the resulting range of the transformed feature values is larger than for the previous scalers and more importantly are approximately similar for both features most of the transformed values lie in a 2 3 range as seen in the zoomedin figure Note that the outliers themselves are still present in the transformed data If a separate outlier clipping is desirable a nonlinear transformation is required see below

makeplot4

PowerTransformer

PowerTransformer applies a power transformation to each feature to make the data more Gaussianlike Cur

scikitlearn user guide Release 0213

rentlyPowerTransformer implements the YeoJohnson and BoxCox transforms The power transform finds the optimal scaling factor to stabilize variance and minimize skewness through maximum likelihood estimation By defaultPowerTransformer also applies zero mean unit variance normalization to the transformed output Note that BoxCox can only be applied to strictly positive data Income and number of households happen to be strictly positive but if negative values are present the YeoJohnson transformed is to be preferred

makeplot5

makeplot6

•

•

QuantileTransformer Gaussian output

QuantileTransformer has an additional outputdistribution parameter allowing to match a Gaussian distribution instead of a uniform distribution Note that this nonparametric transformer introduces saturation artifacts for extreme values

makeplot7

1384 Chapter 5 Examples

QuantileTransformer uniform output

QuantileTransformer applies a nonlinear transformation such that the probability density function of each feature will be mapped to a uniform distribution In this case all the data will be mapped in the range 0 1 even the outliers which cannot be distinguished anymore from the inliers

AsRobustScaler QuantileTransformer is robust to outliers in the sense that adding or removing outliers in the training set will yield approximately the same transformation on held out data But contrary to RobustScaler QuantileTransformer will also automatically collapse any outlier by setting them to the a priori defined range boundaries 0 and 1

makeplot8

Normalizer

TheNormalizer rescales the vector for each sample to have unit norm independently of the distribution of the samples It can be seen on both figures below where all samples are mapped onto the unit circle In our example the two selected features have only positive values therefore the transformed data only lie in the positive quadrant This would not be the case if some original features had a mix of positive and negative values

5262 Label Propagation learning a complex structure

Example of LabelPropagation learning a complex internal structure to demonstrate “manifold learning” The outer circle should be labeled “red” and the inner circle “blue” Because both label groups lie inside their own distinct shape we can see that the labels propagate correctly around the circle

5263 Label Propagation digits: Demonstrating performance
This example demonstrates the power of semisupervised learning by training a Label Spreading model to classify
handwritten digits with sets of very few labels.
The handwritten digit dataset has 1797 total points. The model will be trained using all points but only 30 will be
labeled. Results in the form of a confusion matrix and a series of metrics over each class will be very good.
At the end, the top 10 most uncertain predictions will be shown.
```

5264 Label Propagation digits active learning
Demonstrates an active learning technique to learn handwritten digits using label propagation
We start by training a label propagation model with only 10 labeled points then we select the top five most uncertain
points to label Next we train with 15 labeled points original 10 5 new ones We repeat this process four times
to have a model trained with 30 labeled examples Note you can increase this to label more than 30 by changing
maxiterations Labeling more than 30 can be useful to get a sense for the speed of convergence of this active
learning technique
A plot will appear showing the top 5 most uncertain digits for each iteration of training These may or may not contain
mistakes but we will train the next model with their true labels
526 Semi Supervised Classification 1393

5275 SVM (Support Vector Machine) Separating hyperplane for unbalanced classes

Find the optimal separating hyperplane using an SVC (Support Vector Classification) for classes that are unbalanced

We first find the separating plane with a plain SVC (Support Vector Classification) and then plot dashed the separating hyperplane with automatic

correction for unbalanced classes

Note This example will also work by replacing SVCkernellinear with

SGDClassifierlosshinge Setting the loss parameter of the SGDClassifier equal tohinge will

yield behaviour such as that of a SVC (Support Vector Classification) with a linear kernel

For example try instead of the SVC (Support Vector Classification)

52711 Plot different SVM (Support Vector Machine) classifiers in the iris dataset

Comparison of different linear SVM (Support Vector Machine) classifiers on a 2D projection of the iris dataset We only consider the first 2 features of this dataset

- Sepal length
- Sepal width

This example shows how to plot the decision surface for four SVM (Support Vector Machine) classifiers with different kernels

The linear models LinearSVC andSVCKernellinear yield slightly different decision boundaries

This can be a consequence of the following differences

- LinearSVC minimizes the squared hinge loss while SVC (Support Vector Classification) minimizes the regular hinge loss
- LinearSVC uses the OnevsAll also known as OnevsRest multiclass reduction while SVC (Support Vector Classification) uses the One vsOne multiclass reduction

Both linear models have linear decision boundaries intersecting hyperplanes while the nonlinear kernel models polynomial or Gaussian RBF (Radial Basis Function) have more flexible nonlinear decision boundaries with shapes that depend on the kind of kernel and its parameters

1418 Chapter 5 Examples

52712 Scaling the regularization parameter for SVCs

The following example illustrates the effect of scaling the regularization parameter when using Support Vector Machines for classification. For SVC (Support Vector Classification) classification we are interested in a risk minimization for the equation

$$\min_{\mathbf{w}} \frac{1}{2} \|\mathbf{w}\|^2 + C \sum_{i=1}^n \max(0, 1 - y_i \mathbf{w} \cdot \mathbf{x}_i)$$

where

- $\|\mathbf{w}\|^2$ is used to set the amount of regularization
- \mathcal{L} is a loss function of our samples and our model parameters
-

is a penalty function of our model parameters

If we consider the loss function to be the individual error per sample then the data fit term or the sum of the error for each sample will increase as we add more samples. The penalization term however will not increase.

When using for example cross validation to set the amount of regularization with C there will be a different amount of samples between the main problem and the smaller problems within the folds of the cross validation.

Since our loss function is dependent on the amount of samples the latter will influence the selected value of C . The question that arises is: How do we optimally adjust C to account for the different amount of training samples?

The figures below are used to illustrate the effect of scaling our C to compensate for the change in the number of samples in the case of using an l_1 penalty as well as the l_2 penalty.

l_1 penalty case

In the l_1 case theory says that prediction consistency (i.e. that under given hypothesis the estimator learned predicts as well as a model knowing the true distribution) is not possible because of the bias of the l_1 . It does say however that model consistency in terms of finding the right set of nonzero parameters as well as their signs can be achieved by scaling C .

l_2 penalty case

The theory says that in order to achieve prediction consistency the penalty parameter should be kept constant as the number of samples grow.

527 Support Vector Machines 1421

Simulations

The two figures below plot the values of C on the x-axis and the corresponding crossvalidation scores on the y-axis for several different fractions of a generated dataset

In the l_1 penalty case the crossvalidation error correlates best with the test error when scaling our C with the number of samples n which can be seen in the first figure

For the l_2 penalty case the best result comes from the case where C is not scaled

Note

Two separate datasets are used for the two different plots The reason behind this is the l_1 case works better on sparse data while l_2 is better suited to the non sparse case

52713 RBF (Radial Basis Function) SVM (Support Vector Machine) parameters

This example illustrates the effect of the parameters gamma and C of the Radial Basis Function RBF (Radial Basis Function) kernel SVM (Support Vector Machine). Intuitively the gamma parameter defines how far the influence of a single training example reaches with low values meaning ‘far’ and high values meaning ‘close’. The gamma parameters can be seen as the inverse of the radius of influence of samples selected by the model as support vectors.

The C parameter trades off correct classification of training examples against maximization of the decision function’s margin. For larger values of C a smaller margin will be accepted if the decision function is better at classifying all training points correctly. A lower C will encourage a larger margin therefore a simpler decision function at the cost of training accuracy. In other words ‘C’ behaves as a regularization parameter in the SVM (Support Vector Machine). The first plot is a visualization of the decision function for a variety of parameter values on a simplified classification problem involving only 2 input features and 2 possible target classes binary classification. Note that this kind of plot is not possible to do for problems with more features or target classes.

The second plot is a heatmap of the classifier’s crossvalidation accuracy as a function of C and gamma. For this example we explore a relatively large grid for illustration purposes. In practice a logarithmic grid from 10⁻³ to 10³ is usually sufficient. If the best parameters lie on the boundaries of the grid it can be extended in that direction in a subsequent search.

Note that the heat map plot has a special colorbar with a midpoint value close to the score values of the best performing models so as to make it easy to tell them apart in the blink of an eye.

The behavior of the model is very sensitive to the gamma parameter. If gamma is too large the radius of the area of influence of the support vectors only includes the support vector itself and no amount of regularization with C will be able to prevent overfitting.

When gamma is very small the model is too constrained and cannot capture the complexity or “shape” of the data. The region of influence of any selected support vector would include the whole training set. The resulting model will behave similarly to a linear model with a set of hyperplanes that separate the centers of high density of any pair of two classes.

For intermediate values we can see on the second plot that good models can be found on a diagonal of C and gamma. Smooth models lower gamma values can be made more complex by increasing the importance of classifying each point correctly larger C values hence the diagonal of good performing models.

Finally one can also observe that for some intermediate values of gamma we get equally performing models when C becomes very large. It is not necessary to regularize by enforcing a larger margin. The radius of the RBF (Radial Basis Function) kernel alone acts as a good structural regularizer. In practice though it might still be interesting to simplify the decision function with a lower value of C so as to favor models that use less memory and that are faster to predict.

We should also note that small differences in scores results from the random splits of the crossvalidation procedure. Those spurious variations can be smoothed out by increasing the number of CV (Cross-Validation) iterations n_splits at the expense of compute time. Increasing the value number of C_range and gamma_range steps will increase the resolution of the hyperparameter heat map.

defcallself value clipNone
x y selfvmin selfmidpoint selfvmax 0 05 1
returnnp.ma.masked_array(np.interp(value, x, y
```

Load and prepare data set

```
dataset for grid search
iris loadiris
X irisdata
y iristarget
Dataset for decision function visualization we only keep the first two
features in X and subsample the dataset to keep only 2 classes and
make it a binary classification problem
X2d X 2
X2d X2dy 0
y2d yy 0
y2d 1
```

```
It is usually a good idea to scale the data for SVM (Support Vector Machine) training
We are cheating a bit in this example in scaling all of the data
instead of fitting the transformation on the training set and
just applying it on the test set
scaler StandardScaler
X scaler.fit_transform(X)
X2d scaler.fit_transform(X2d)
```

Train classifiers

```
For an initial search a logarithmic grid with basis
10 is often helpful Using a basis of 2 a finer
tuning can be achieved but at a much higher cost
Crange np.logspace(2, 10, 13)
gamma_range np.logspace(-9, 3, 13)
param_grid dict(gamma=gamma_range, C=Crange)
cv StratifiedShuffleSplit(n_splits=5, test_size=0.2, random_state=42)
grid GridSearchCV(SVC(), param_grid, cv=cv)
grid.fit(X, y)
print("The best parameters are with a score of %2f" %
      grid.best_params_)
grid.best_params_
grid.best_score_
Now we need to fit a classifier for all parameters in the 2d version
we use a smaller set of parameters here because it takes a while to train

5281 FeatureHasher and DictVectorizer Comparison

Compares FeatureHasher and DictVectorizer by using both to vectorize text documents

The example demonstrates syntax and speed only it doesn't actually do anything useful with the extracted vectors

See the example scripts documentclassification20newsgroupsclusteringpy for actual learning on text documents

A discrepancy between the number of terms reported for DictVectorizer and for FeatureHasher is to be expected due to hash collisions

5282 Clustering text documents using kmeans

This is an example showing how the scikitlearn can be used to cluster documents by topics using a bagofwords approach This example uses a scipysparse matrix to store the features instead of standard numpy arrays

Two feature extraction methods can be used in this example

- TfidfVectorizer uses a inmemory vocabulary a python dict to map the most frequent words to features indices and hence compute a word occurrence frequency sparse matrix The word frequencies are then reweighted using the Inverse Document Frequency IDF vector collected featurewise over the corpus
- HashingVectorizer hashes word occurrences to a fixed dimensional space possibly with collisions The word count vectors are then normalized to each have l2norm equal to one projected to the euclidean unitball which seems to be important for kmeans to work in high dimensional space

HashingVectorizer does not provide IDF weighting as this is a stateless model the fit method does nothing

When IDF weighting is needed it can be added by pipelining its output to a TfidfTransformer instance

Two algorithms are demoed ordinary kmeans and its more scalable cousin minibatch kmeans

Additionally latent semantic analysis can also be used to reduce dimensionality and discover latent patterns in the data

It can be noted that kmeans and minibatch kmeans are very sensitive to feature scaling and that in this case the IDF weighting helps improve the quality of the clustering by quite a lot as measured against the “ground truth” provided by the class label assignments of the 20 newsgroups dataset

This improvement is not visible in the Silhouette Coefficient which is small for both as this measure seem to suffer from the phenomenon called “Concentration of Measure” or “Curse of Dimensionality” for high dimensional datasets

scikitlearn user guide Release 0213

such as text data Other measures such as Vmeasure and Adjusted Rand Index are information theoretic based evaluation scores as they are only based on cluster assignments rather than distances hence not affected by the curse of dimensionality

Note as kmeans is optimizing a nonconvex objective function it will likely end up in a local optimum Several runs with independent random init might be necessary to get a good convergence

5291 Decision Tree Regression
A 1D regression with decision tree
Thedecision trees is used to fit a sine curve with addition noisy observation As a result it learns local linear regres
sions approximating the sine curve
We can see that if the maximum depth of the tree controlled by the maxdepth parameter is set too high the
decision trees learn too fine details of the training data and learn from the noise ie they overfit

5293 Plot the decision surface of a decision tree on the iris dataset

Plot the decision surface of a decision tree trained on pairs of features of the iris dataset

Seedecision tree for more information on the estimator

For each pair of iris features the decision tree learns decision boundaries made of combinations of simple thresholding rules inferred from the training samples

We also show the tree structure of a model built on all of the features

5294 Understanding the decision tree structure
The decision tree structure can be analysed to gain further insight on the relation between the features and the target
to predict In this example we show how to retrieve
• the binary tree structure
• the depth of each node and whether or not it's a leaf
• the nodes that were reached by a sample using the decisionpath method
• the leaf that was reached by a sample using the apply method
• the rules that were used to predict a sample
• the decision path shared by a group of samples
Out
The binary tree structure has 5 nodes and has the following tree structure
node0 test node go to node 1 if X 3 0800000011920929 else to node 2
node1 leaf node
node2 test node go to node 3 if X 2 4950000047683716 else to node 4
node3 leaf node
1454 Chapter 5 Examples
```

scikitlearn user guide Release 0213

Rules used to predict sample 0

decision id node 0 Xtest0 3 24 0800000011920929

decision id node 2 Xtest0 2 51 4950000047683716

The following samples 0 1 share the node 0 2 in the tree

It is 400 of all nodes

import numpy as np

from sklearnmodelselection import traintestsplit

from sklearndatasets import loadiris

from sklearnntree import DecisionTreeClassifier

iris loadiris

X irisdata

y iristarget

Xtrain Xtest ytrain ytest traintestsplitX y randomstate0

estimator DecisionTreeClassifiermaxleafnodes3 randomstate0

estimatorfitXtrain ytrain

The decision estimator has an attribute called tree which stores the entire tree structure and allows access to low level attributes The binary tree is represented as a number of parallel arrays The ith element of each array holds information about the node i Node 0 is the trees root NOTE Some of the arrays only apply to either leaves or split nodes resp In this case the values of nodes of the other type are arbitrary

Among those arrays we have

leftchild id of the left child of the node

rightchild id of the right child of the node

feature feature used for splitting the node

threshold threshold value at the node

Using those arrays we can parse the tree structure

nnodes estimatortreenodecount

childrenleft estimatortreechildrenleft

childrenright estimatortreechildrenright

feature estimatortreefeature

threshold estimatortreethreshold

The tree structure can be traversed to compute various properties such

as the depth of each node and whether or not it is a leaf

nodedepth npzerosshapennodes dtypepint64

API (Application Programming Interface) REFERENCE

This is the class and function reference of scikitlearn Please refer to the full user guide for further details as the class and function raw specifications may not be enough to give full guidelines on their uses For reference on concepts repeated across the API (Application Programming Interface) see Glossary of Common Terms and API (Application Programming Interface) Element

61sklearnbase Base classes and utility functions

Base classes for all estimators

611 Base classes

baseBaseEstimator Base class for all estimators in scikitlearn

baseBiclustermixin Mixin class for all biclustermixin estimators in scikitlearn

baseClassifierMixin Mixin class for all classifiers in scikitlearn

baseClusterMixin Mixin class for all cluster estimators in scikitlearn

baseDensityMixin Mixin class for all density estimators in scikitlearn

baseRegressorMixin Mixin class for all regression estimators in scikitlearn

baseTransformerMixin Mixin class for all transformers in scikitlearn

sklearnbase BaseEstimator

classsklearnbase BaseEstimator

Base class for all estimators in scikitlearn

Notes

All estimators should specify all the parameters that can be set at the class level in their init as explicit

keyword arguments no args orkwargs

Methods

getparams self deep Get parameters for this estimator

setparams self params Set the parameters of this estimator

1459

scikitlearn user guide Release 0213

init selfargs kwargs

Initialize self See helptypeself for accurate signature

getparams selfdeepTrue

Get parameters for this estimator

Parameters

deep boolean optional If True will return the parameters for this estimator and contained

subobjects that are estimators

Returns

params mapping of string to any Parameter names mapped to their values

setparams selfparams

Set the parameters of this estimator

The method works on simple estimators as well as on nested objects such as pipelines The latter have

parameters of the form componentparameter so that it's possible to update each component

of a nested object

Returns

self

Examples using sklearnbaseBaseEstimator

- Inductive Clustering

- Column Transformer with Heterogeneous Data Sources

sklearnbase Biclustermixin

classssklearnbase Biclustermixin

Mixin class for all bicluster estimators in scikitlearn

Attributes

biclusters Convenient way to get row and column indicators together

Methods

getindices self i Row and column indices of the i'th bicluster

getshape self i Shape of the i'th bicluster

getsubmatrix self i data Returns the submatrix corresponding to bicluster i

init selfargs kwargs

Initialize self See helptypeself for accurate signature

biclusters

Convenient way to get row and column indicators together

Returns the rows andcolumns members

getindices selfi

Row and column indices of the i'th bicluster

1460 Chapter 6 API (Application Programming Interface) Reference

scikitlearn user guide Release 0213

Only works if rows andcolumns attributes exist

Parameters

iint The index of the cluster

Returns

rowind nparray dtypepintp Indices of rows in the dataset that belong to the bicluster

colind nparray dtypepintp Indices of columns in the dataset that belong to the biclus

ter

getshape selfi

Shape of the i'th bicluster

Parameters

iint The index of the cluster

Returns

shape int int Number of rows and columns resp in the bicluster

getsubmatrix selfidata

Returns the submatrix corresponding to bicluster i

Parameters

iint The index of the cluster

data array The data

Returns

submatrix array The submatrix corresponding to bicluster i

Notes

Works with sparse matrices Only works if rows andcolumns attributes exist

sklearnbase ClassifierMixin

classsklearnbase ClassifierMixin

Mixin class for all classifiers in scikitlearn

Methods

score self X y sampleweight Returns the mean accuracy on the given test data and labels

init selfargs kwargs

Initialize self See helptypeself for accurate signature

scoreselfXysampleweightNone

Returns the mean accuracy on the given test data and labels

In multilabel classification this is the subset accuracy which is a harsh metric since you require for each sample that each label set be correctly predicted

61sklearnbase Base classes and utility functions 1461

scikitlearn user guide Release 0213

Parameters

Xarraylike shape nsamples nfeatures Test samples

yarraylike shape nsamples or nsamples noutputs True labels for X

sampleweight arraylike shape nsamples optional Sample weights

Returns

score float Mean accuracy of selfpredictX wrt y

sklearnbase ClusterMixin

classsklearnbase ClusterMixin

Mixin class for all cluster estimators in scikitlearn

Methods

fitpredict self X y Performs clustering on X and returns cluster labels

init selfargs kwargs

Initialize self See helptypeself for accurate signature

fitpredict selfXyNone

Performs clustering on X and returns cluster labels

Parameters

Xndarray shape nsamples nfeatures Input data

yIgnored not used present for API (Application Programming Interface) consistency by convention

Returns

labels ndarray shape nsamples cluster labels

sklearnbase DensityMixin

classsklearnbase DensityMixin

Mixin class for all density estimators in scikitlearn

Methods

score self X y Returns the score of the model on the data X

init selfargs kwargs

Initialize self See helptypeself for accurate signature

scoreselfXyNone

Returns the score of the model on the data X

Parameters

Xarraylike shape nsamples nfeatures

1462 Chapter 6 API (Application Programming Interface) Reference

scikitlearn user guide Release 0213

Returns
score float
sklearnbase RegressorMixin
class sklearnbase RegressorMixin
Mixin class for all regression estimators in scikitlearn
Methods
score self X y sampleweight Returns the coefficient of determination R2 of the prediction
init selfargs kwargs
Initialize self See helptypeself for accurate signature
score selfXsampleweightNone
Returns the coefficient of determination R2 of the prediction
The coefficient R2 is defined as $1 - \frac{u}{v}$ where u is the residual sum of squares $y_{true} - y_{pred}$
2sum and v is the total sum of squares $y_{true} - y_{truemean}$ 2sum The best possible score
is 1.0 and it can be negative because the model can be arbitrarily worse A constant model that always
predicts the expected value of y disregarding the input features would get a R2 score of 0.0
Parameters
Xarraylike shape (n_samples, n_features) Test samples For some estimators this may
be a precomputed kernel matrix instead shape (n_samples, n_samplesfitted) where
n_samplesfitted is the number of samples used in the fitting for the estimator
yarraylike shape (n_samples) or (n_samples, n_outputs) True values for X
sampleweight arraylike shape (n_samples) optional Sample weights
Returns
score float R2 of selfpredictX wrt y
Notes
The R2 score used when calling score on a regressor will use multioutputuniformaverage
from version 0.23 to keep consistent with metricsr2score This will influence the score
method of all the multioutput regressors except for multioutputMultiOutputRegressor
To specify the default value manually and avoid the warning please either call metricsr2score
directly or make a custom scorer with metricsmakescorer the builtin scorer r2 uses
multioutputuniformaverage
sklearnbase TransformerMixin
class sklearnbase TransformerMixin
Mixin class for all transformers in scikitlearn
61sklearnbase Base classes and utility functions 1463

scikitlearn user guide Release 0213

Methods

fittransform self X y Fit to data then transform it

init selfargs kwargs

Initialize self See helptypeself for accurate signature

fittransform selfXyNone fitparams

Fit to data then transform it

Fits transformer to X and y with optional parameters fitparams and returns a transformed version of X

Parameters

Xnumpy array of shape nsamples nfeatures Training set

ynumpy array of shape nsamples Target values

Returns

Xnew numpy array of shape nsamples nfeaturesnew Transformed array

Examples using sklearnbaseTransformerMixin

•Column Transformer with Heterogeneous Data Sources

612 Functions

baseclone estimator safe Constructs a new estimator with the same parameters

baseisclassifier estimator Returns True if the given estimator is probably a classifier

baseisregressor estimator Returns True if the given estimator is probably a regressor

configcontext newconfig Context manager for global scikitlearn configuration

getconfig Retrieve current values for configuration set by

setconfig

setconfig assumefinite workingmemory Set global scikitlearn configuration

showversions Print useful debugging information

sklearnbase clone

sklearnbase cloneestimator safeTrue

Constructs a new estimator with the same parameters

Clone does a deep copy of the model in an estimator without actually copying attached data It yields a new estimator with the same parameters that has not been fit on any data

Parameters

estimator estimator object or list tuple or set of objects The estimator or group of estimators to be cloned

safe boolean optional If safe is false clone will fall back to a deep copy on objects that are not estimators

1464 Chapter 6 API (Application Programming Interface) Reference

scikitlearn user guide Release 0213

sklearnbase isclassifier

sklearnbase isclassifier estimator

Returns True if the given estimator is probably a classifier

Parameters

estimator object Estimator object to test

Returns

out bool True if estimator is a classifier and False otherwise

sklearnbase isregressor

sklearnbase isregressor estimator

Returns True if the given estimator is probably a regressor

Parameters

estimator object Estimator object to test

Returns

out bool True if estimator is a regressor and False otherwise

sklearn configcontext

sklearn configcontext newconfig

Context manager for global scikitlearn configuration

Parameters

assumeinfinite bool optional If True validation for finiteness will be skipped saving time but

leading to potential crashes If False validation for finiteness will be performed avoiding

error Global default False

workingmemory int optional If set scikitlearn will attempt to limit the size of temporary

arrays to this number of MiB per job when parallelised often saving both computation

time and memory on expensive operations that can be performed in chunks Global default

1024

62sklearncalibration Probability Calibration

Calibration of predicted probabilities

User guide See the Probability calibration section for further details

calibrationCalibratedClassifierCV Probability calibration with isotonic regression or sigmoid

621sklearncalibration CalibratedClassifierCV

classsklearncalibration CalibratedClassifierCV baseestimatorNone

method'sigmoid' cv'warn'

Probability calibration with isotonic regression or sigmoid

See glossary entry for crossvalidation estimator

With this class the baseestimator is fit on the train set of the crossvalidation generator and the test set is used

for calibration The probabilities for each of the folds are then averaged for prediction In case that cv"prefit"

is passed to init it is assumed that baseestimator has been fitted already and all data is used for calibration

Note that data for fitting the classifier and for calibrating it must be disjoint

Read more in the User Guide

Parameters

baseestimator instance BaseEstimator The classifier whose output decision function needs

to be calibrated to offer more accurate predictproba outputs If cvprefit the classifier must

have been fit already on data

method 'sigmoid' or 'isotonic' The method to use for calibration Can be 'sigmoid' which

corresponds to Platt's method or 'isotonic' which is a nonparametric approach It is not

advised to use isotonic calibration with too few calibration samples 1000 since it

tends to overfit Use sigmoids Platt's calibration in this case

cvinteger crossvalidation generator iterable or "prefit" optional Determines the cross

validation splitting strategy Possible inputs for cv are

- None to use the default 3fold crossvalidation
- integer to specify the number of folds
- CV (Cross-Validation) splitter
- An iterable yielding train test splits as arrays of indices

62sklearncalibration Probability Calibration 1467

scikitlearn user guide Release 0213

For integerNone inputs if yis binary or multiclass sklearnmodelselection
StratifiedKFold is used If yis neither binary nor multiclass sklearn
modelselectionKFold is used

Refer User Guide for the various crossvalidation strategies that can be used here

If “prefit” is passed it is assumed that baseestimator has been fitted already and all data is
used for calibration

Changed in version 020 cvdefault value if None will change from 3fold to 5fold in
v022

Attributes

classes array shape nclasses The class labels

calibratedclassifiers list len equal to cv or 1 if cv “prefit” The list of calibrated
classifiers one for each crossvalidation fold which has been fitted on all but the validation
fold and calibrated on the validation fold

scikitlearn user guide Release 0213

calibrationcalibrationcurve ytrue

yprobCompute true and predicted probabilities for a calibration curve

622sklearncalibration calibrationcurve

sklearncalibration calibrationcurve ytrue yprob normalizeFalse nbins5 strategy'uniform'

Compute true and predicted probabilities for a calibration curve

The method assumes the inputs come from a binary classifier

Calibration curves may also be referred to as reliability diagrams

Read more in the User Guide

Parameters

ytrue array shape nsamples True targets

yprob array shape nsamples Probabilities of the positive class

normalize bool optional defaultFalse Whether yprob needs to be normalized into the bin

0 1 ie is not a proper probability If True the smallest value in yprob is mapped onto

0 and the largest one onto 1

nbins int Number of bins A bigger number requires more data Bins with no data points

ie without corresponding values in yprob will not be returned thus there may be fewer

than nbins in the return value

strategy 'uniform' 'quantile' default'uniform' Strategy used to define the widths of the bins

uniform All bins have identical widths

quantile All bins have the same number of points

Returns

probtrue array shape nbins or smaller The true probability in each bin fraction of positives

probpred array shape nbins or smaller The mean predicted probability in each bin

clusterDBSCAN eps minsamples metric Perform DBSCAN clustering from vector array or distance matrix

clusterOPTICS minsamples maxeps Estimate clustering structure from vector array

clusterFeatureAgglomeration nclusters

Agglomerate features

clusterKMeans nclusters init ninit KMeans clustering

clusterMiniBatchKMeans nclusters init MiniBatch KMeans clustering

clusterMeanShift bandwidth seeds Mean shift clustering using a flat kernel

clusterSpectralClustering nclusters Apply clustering to a projection of the normalized Laplacian

sklearncluster AffinityPropagation

classsklearncluster AffinityPropagation damping05 maxiter200 conver

genceiter15 copyTrue preferenceNone

affinity'euclidean' verboseFalse

Perform Affinity Propagation Clustering of data

Read more in the User Guide

Parameters

damping float optional default 05 Damping factor between 05 and 1 is the extent to which the current value is maintained relative to incoming values weighted 1 damping

This in order to avoid numerical oscillations when updating these values messages

maxiter int optional default 200 Maximum number of iterations

convergenceiter int optional default 15 Number of iterations with no change in the number of estimated clusters that stops the convergence

copy boolean optional default True Make a copy of input data

preference arraylike shape nsamples or float optional Preferences for each point points with larger values of preferences are more likely to be chosen as exemplars The number of exemplars ie of clusters is influenced by the input preferences value If the preferences are not passed as arguments they will be set to the median of the input similarities

affinity string optional default''euclidean'' Which affinity to use At the moment precomputed andeuclidean are supported euclidean uses the negative squared

euclidean distance between points

verbose boolean optional default False Whether to be verbose

Attributes

63sklearncluster Clustering 1471

scikitlearn user guide Release 0213

clustercentersindices array shape nclusters Indices of cluster centers
clustercenters array shape nclusters nfeatures Cluster centers if affinity
precomputed

labels array shape nsamples Labels of each point
affinitymatrix array shape nsamples nsamples Stores the affinity matrix used in fit
niter int Number of iterations taken to converge

Notes

For an example see examplesclusterplotaffinitypropagationpy
The algorithmic complexity of affinity propagation is quadratic in the number of points
Whenfit does not converge clustercenters becomes an empty array and all training samples will be
labelled as1 In addition predict will then label every sample as 1
When all training samples have equal similarities and equal preferences the assignment of cluster centers and
labels depends on the preference If the preference is smaller than the similarities fit will result in a single
cluster center and label 0for every sample Otherwise every training sample becomes its own cluster center
and is assigned a unique label

Examples using sklearnclusterAffinityPropagation

- Demo of affinity propagation clustering algorithm
- Comparing different clustering algorithms on toy datasets

sklearncluster AgglomerativeClustering

classsklearncluster AgglomerativeClustering nclusters2 affinity'euclidean' mem

oryNone connectivityNone com

putefulltree'auto' linkage'ward'

poolingfunc'deprecated' dis

tancethresholdNone

Agglomerative Clustering

Recursively merges the pair of clusters that minimally increases a given linkage distance

Read more in the User Guide

Parameters

nclusters int or None optional default2 The number of clusters to find It must be None

ifdistancethreshold is notNone

affinity string or callable default "euclidean" Metric used to compute the linkage Can be

"euclidean" "l1" "l2" "manhattan" "cosine" or "precomputed" If linkage is "ward"

only "euclidean" is accepted If "precomputed" a distance matrix instead of a similarity

matrix is needed as input for the fit method

memory None str or object with the joblibMemory interface optional Used to cache the

output of the computation of the tree By default no caching is done If a string is given it

is the path to the caching directory

connectivity arraylike or callable optional Connectivity matrix Defines for each sample the

neighboring samples following a given structure of the data This can be a connectivity

matrix itself or a callable that transforms the data into a connectivity matrix such as de

rived from kneighborsgraph Default is None ie the hierarchical clustering algorithm is

unstructured

computealltree bool or 'auto' optional Stop early the construction of the tree at

nclusters This is useful to decrease computation time if the number of clusters is not small

compared to the number of samples This option is useful only when specifying a connec

tivity matrix Note also that when varying the number of clusters and using caching it may

be advantageous to compute the full tree It must be True ifdistancethreshold is

notNone

linkage "ward" "complete" "average" "single" optional default"ward" Which linkage

criterion to use The linkage criterion determines which distance to use between sets of

observation The algorithm will merge the pairs of cluster that minimize this criterion

- ward minimizes the variance of the clusters being merged
- average uses the average of the distances of each observation of the two sets
- complete or maximum linkage uses the maximum distances between all observations of the two sets

- single uses the minimum of the distances between all observations of the two sets

scikitlearn user guide Release 0213

sklearncluster Birch

class sklearncluster Birchthreshold05 branchingfactor50 nclusters3 com

putelabelsTrue copyTrue

Implements the Birch clustering algorithm

It is a memoryefficient onlinelearning algorithm provided as an alternative to MiniBatchKMeans It constructs a tree data structure with the cluster centroids being read off the leaf These can be either the final cluster centroids or can be provided as input to another clustering algorithm such as AgglomerativeClustering

Read more in the User Guide

Parameters

threshold float default 05 The radius of the subcluster obtained by merging a new sample and the closest subcluster should be lesser than the threshold Otherwise a new subcluster is started Setting this value to be very low promotes splitting and viceversa

branchingfactor int default 50 Maximum number of CF subclusters in each node If a new samples enters such that the number of subclusters exceed the branchingfactor then that node is split into two nodes with the subclusters redistributed in each The parent subcluster of that node is removed and two new subclusters are added as parents of the 2 split nodes nclusters int instance of sklearncluster model default 3 Number of clusters after the final clustering step which treats the subclusters from the leaves as new samples

•None the final clustering step is not performed and the subclusters are returned as they are

•sklearncluster Estimator If a model is provided the model is fit treating the subclusters as new samples and the initial data is mapped to the label of the closest subcluster

•int the model fit is AgglomerativeClustering withnclusters set to be equal to the int

computelabels bool default True Whether or not to compute labels for each fit

copy bool default True Whether or not to make a copy of the given data If set to False the initial data will be overwritten

Attributes

root CFNode Root of the CFTree

dummyleaf CFNode Start pointer to all the leaves

subclustercenters ndarray Centroids of all subclusters read directly from the leaves

subclusterlabels ndarray Labels assigned to the centroids of the subclusters after they are clustered globally

labels ndarray shape nsamples Array of labels assigned to the input data if partialfit is used instead of fit they are assigned to the last batch of data

Notes

The tree data structure consists of nodes with each node consisting of a number of subclusters The maximum number of subclusters in a node is determined by the branching factor Each subcluster maintains a linear sum squared sum and the number of samples in that subcluster In addition each subcluster can also have a node as its child if the subcluster is not a member of a leaf node

63sklearncluster Clustering 1477

scikitlearn user guide Release 0213

For a new point entering the root it is merged with the subcluster closest to it and the linear sum squared sum and the number of samples of that subcluster are updated This is done recursively till the properties of the leaf node are updated

ylgnored

fitpredict selfXyNone

Performs clustering on X and returns cluster labels

Parameters

Xndarray shape nsamples nfeatures Input data

scikitlearn user guide Release 0213

ylgnored not used present for API (Application Programming Interface) consistency by convention

Returns

labels ndarray shape nsamples cluster labels

fittransform selfXyNone fitparams

Fit to data then transform it

Fits transformer to X and y with optional parameters fitparams and returns a transformed version of X

Parameters

Xnumpy array of shape nsamples nfeatures Training set

ynumpy array of shape nsamples Target values

Returns

Xnew numpy array of shape nsamples nfeaturesnew Transformed array

getparams selfdeepTrue

Get parameters for this estimator

Parameters

deep boolean optional If True will return the parameters for this estimator and contained

subobjects that are estimators

Returns

params mapping of string to any Parameter names mapped to their values

partialfit selfXNone yNone

Online learning Prevents rebuilding of CFTree from scratch

Parameters

Xarraylike sparse matrix shape nsamples nfeatures None Input data If X is not

provided only the global clustering step is done

ylgnored

predictselfX

Predict data using the centroids of subclusters

Avoid computation of the row norms of X

Parameters

Xarraylike sparse matrix shape nsamples nfeatures Input data

Returns

labels ndarray shapensamples Labelled data

setparams selfparams

Set the parameters of this estimator

The method works on simple estimators as well as on nested objects such as pipelines The latter have

parameters of the form componentparameter so that it's possible to update each component

of a nested object

Returns

self

63sklearncluster Clustering 1479

scikitlearn user guide Release 0213

transform selfX

Transform X into subcluster centroids dimension

Each dimension represents the distance from the sample point to each cluster centroid

Parameters

Xarraylike sparse matrix shape nsamples nfeatures Input data

Returns

Xtrans arraylike sparse matrix shape nsamples nclusters Transformed data

Examples using sklearnclusterBirch

- Compare BIRCH and MiniBatchKMeans
- Comparing different clustering algorithms on toy datasets

sklearncluster DBSCAN

classsklearncluster DBSCANeps05 minsamples5 metric'euclidean' metricparamsNone

algorithm'auto' leafsize30 pNone njobsNone

Perform DBSCAN clustering from vector array or distance matrix

DBSCAN DensityBased Spatial Clustering of Applications with Noise Finds core samples of high density

and expands clusters from them Good for data which contains clusters of similar density

Read more in the User Guide

Parameters

eps float optional The maximum distance between two samples for one to be considered as in the neighborhood of the other This is not a maximum bound on the distances of points within a cluster This is the most important DBSCAN parameter to choose appropriately for your data set and distance function

minsamples int optional The number of samples or total weight in a neighborhood for a point to be considered as a core point This includes the point itself

metric string or callable The metric to use when calculating distance between instances in a feature array If metric is a string or callable it must be one of the options allowed

by sklearnmetricspairwiselocalities for its metric parameter If metric

is "precomputed" X is assumed to be a distance matrix and must be square X may be

a sparse matrix in which case only "nonzero" elements may be considered neighbors for DBSCAN

New in version 017 metric precomputed to accept precomputed sparse matrix

metricparams dict optional Additional keyword arguments for the metric function

New in version 019

algorithm 'auto' 'balltree' 'kdtree' 'brute' optional The algorithm to be used by the NearestNeighbors module to compute pointwise distances and find nearest neighbors See NearestNeighbors module documentation for details

leafsize int optional default 30 Leaf size passed to BallTree or cKDTree This can affect the speed of the construction and query as well as the memory required to store the tree The optimal value depends on the nature of the problem

1480 Chapter 6 API (Application Programming Interface) Reference

scikitlearn user guide Release 0213

pfloat optional The power of the Minkowski metric to be used to calculate distance between points

njobs int or None optional defaultNone The number of parallel jobs to run None means 1 unless in a joblibparallelbackend context1means using all processors See Glossary for more details

Attributes

coresampleindices array shape ncoresamples Indices of core samples

components array shape ncoresamples nfeatures Copy of each core sample found by training

labels array shape nsamples Cluster labels for each point in the dataset given to fit

Noisy samples are given the label 1

See also

OPTICS A similar clustering at multiple values of eps Our implementation is optimized for memory usage

Notes

For an example see examplesclusterplotdbscanpy

This implementation bulkcomputes all neighborhood queries which increases the memory complexity to $O(dn)$ where d is the average number of neighbors while original DBSCAN had memory complexity $O(n)$ On It may attract a higher memory complexity when querying these nearest neighborhoods depending on the algorithm

One way to avoid the query complexity is to precompute sparse neighborhoods in chunks usingNearestNeighborsradiusneighborsgraph withmodedistance then using metricprecomputed here

Another way to reduce memory and computation time is to remove nearduplicate points and use sampleweight instead

clusterOPTICS provides a similar clustering with lower memory usage

ricparamsNone clustermethod'xi' epsNone xi005 prede

cessorcorrectionTrue minclustersizeNone algorithm'auto'

leafsize30 njobsNone

Estimate clustering structure from vector array

OPTICS Ordering Points To Identify the Clustering Structure closely related to DBSCAN finds core sample

of high density and expands clusters from them R2c55e37003fe1 Unlike DBSCAN keeps cluster hierarchy

for a variable neighborhood radius Better suited for usage on large datasets than the current sklearn implemen

tation of DBSCAN

Clusters are then extracted using a DBSCANlike method clustermethod 'dbscan' or an automatic technique

proposed in R2c55e37003fe1 clustermethod 'xi'

This implementation deviates from the original OPTICS by first performing knearestneighborhood searches

on all points to identify core sizes then computing only the distances to unprocessed points when constructing

the cluster order Note that we do not employ a heap to manage the expansion candidates so the time complexity

will be On2

Read more in the User Guide

Parameters

minsamples int 1 or float between 0 and 1 default5 The number of samples in a neigh

borhood for a point to be considered as a core point Also up and down steep regions can't

have more then minsamples consecutive nonsteep points Expressed as an absolute

number or a fraction of the number of samples rounded to be at least 2

maxeps float optional defaultnpinf The maximum distance between two samples for one

to be considered as in the neighborhood of the other Default value of npinf will identify

clusters across all scales reducing maxeps will result in shorter run times

metric string or callable optional default'minkowski' Metric to use for distance computa

tion Any metric from scikitlearn or scipyspatialdistance can be used

If metric is a callable function it is called on each pair of instances rows and the resulting

value recorded The callable should take two arrays as input and return one value indicating

63sklearncluster Clustering 1483

scikitlearn user guide Release 0213

the distance between them This works for Scipy’s metrics but is less efficient than passing the metric name as a string If metric is “precomputed” X is assumed to be a distance matrix and must be square

Valid values for metric are

- from scikitlearn ‘cityblock’ ‘cosine’ ‘euclidean’ ‘l1’ ‘l2’ ‘manhattan’
- from scipyspatialdistance ‘braycurtis’ ‘canberra’ ‘chebyshev’ ‘correlation’ ‘dice’ ‘hamming’ ‘jaccard’ ‘kulsinski’ ‘mahalanobis’ ‘minkowski’ ‘rogerstanimoto’ ‘rus sellrao’ ‘seuclidean’ ‘sokalmichener’ ‘sokalsneath’ ‘sqeuclidean’ ‘yule’

See the documentation for scipyspatialdistance for details on these metrics

pinteger optional default2 Parameter for the Minkowski metric from sklearn

metricspairwisel1distances When p 1 this is equivalent to using manhat

tandistance l1 and euclidean l2 for p 2 For arbitrary p minkowskidistance

lp is used

metricparams dict optional defaultNone Additional keyword arguments for the metric

function

clustermethod string optional default’xi’ The extraction method used to extract clusters

using the calculated reachability and ordering Possible values are “xi” and “dbscan”

eps float optional defaultNone The maximum distance between two samples for one to be

considered as in the neighborhood of the other By default it assumes the same value as

maxeps Used only when clustermethoddbscan

xifloat between 0 and 1 optional default005 Determines the minimum steepness on the

reachability plot that constitutes a cluster boundary For example an upwards point in the

reachability plot is defined by the ratio from one point to its successor being at most 1xi

Used only when clustermethodxi

predecessorcorrection bool optional defaultTrue Correct clusters according to the pre

decessors calculated by OPTICS R2c55e37003fe2 This parameter has minimal effect on

most datasets Used only when clustermethodxi

minclustersize int 1 or float between 0 and 1 defaultNone Minimum number of sam

ples in an OPTICS cluster expressed as an absolute number or a fraction of the number of

samples rounded to be at least 2 If None the value of minsamples is used instead

Used only when clustermethodxi

algorithm ‘auto’ ‘balltree’ ‘kdtree’ ‘brute’ optional Algorithm used to compute the

nearest neighbors

- ‘balltree’ will use BallTree
- ‘kdtree’ will use KDTree
- ‘brute’ will use a brute force search
- ‘auto’ will attempt to decide the most appropriate algorithm based on the values passed

tofit method default

Note fitting on sparse input will override the setting of this parameter using brute force

leafsize int optional default30 Leaf size passed to BallTree orKDTree This can

affect the speed of the construction and query as well as the memory required to store the

tree The optimal value depends on the nature of the problem

1484 Chapter 6 API (Application Programming Interface) Reference

scikitlearn user guide Release 0213

njobs int or None optional defaultNone The number of parallel jobs to run for neighbors searchNone means 1 unless in a joblibparallelbackend context1means using all processors See Glossary for more details

Attributes

labels array shape nsamples Cluster labels for each point in the dataset given to fit Noisy samples and points which are not included in a leaf cluster of clusterhierarchy are labeled as 1

reachability array shape nsamples Reachability distances per sample indexed by object order Useclustreachabilityclustordering to access in cluster order

ordering array shape nsamples The cluster ordered list of sample indices

coredistances array shape nsamples Distance at which each sample becomes a core point indexed by object order Points which will never be core have a distance of inf Use clustcoredistancesclustordering to access in cluster order

predecessor array shape nsamples Point that a sample was reached from indexed by object order Seed points have a predecessor of 1

clusterhierarchy array shape nclusters 2 The list of clusters in the form of start end in each row with all indices inclusive The clusters are ordered according toend start ascending so that larger clusters encompassing smaller clusters come after those smaller ones Since labels does not reflect the hierarchy usually lenclusterhierarchy npuniqueopticslabels Please also note that these indices are of the ordering ieXorderingstartend 1form a cluster Only available when clustermethodxi

affinity string or callable default “euclidean” Metric used to compute the linkage Can be “euclidean” “l1” “l2” “manhattan” “cosine” or ‘precomputed’ If linkage is “ward” only “euclidean” is accepted

memory None str or object with the joblibMemory interface optional Used to cache the output of the computation of the tree By default no caching is done If a string is given it is the path to the caching directory

connectivity arraylike or callable optional Connectivity matrix Defines for each feature the neighboring features following a given structure of the data This can be a connectivity matrix itself or a callable that transforms the data into a connectivity matrix such as derived from kneighborsgraph Default is None ie the hierarchical clustering algorithm is unstructured

computealltree bool or ‘auto’ optional default “auto” Stop early the construction of the tree at nclusters This is useful to decrease computation time if the number of clusters is not small compared to the number of features This option is useful only when specifying a connectivity matrix Note also that when varying the number of clusters and using caching it may be advantageous to compute the full tree It must be True if distancethreshold is notNone

linkage “ward” “complete” “average” “single” optional default“ward” Which linkage criterion to use The linkage criterion determines which distance to use between sets of features The algorithm will merge the pairs of cluster that minimize this criterion

- ward minimizes the variance of the clusters being merged
- average uses the average of the distances of each feature of the two sets
- complete or maximum linkage uses the maximum distances between all features of the two sets
- single uses the minimum of the distances between all observations of the two sets

poolingfunc callable default npmean This combines the values of agglomerated features into a single value and should accept an array of shape M N and the keyword argument axis1 and reduce it to an array of size M

distancethreshold float optional defaultNone The linkage distance threshold above which clusters will not be merged If not None nclusters must beNone and computealltree must beTrue

New in version 021

Attributes

nclusters int The number of clusters found by the algorithm If

distancethresholdNone it will be equal to the given nclusters

labels arraylike nfeatures cluster labels for each feature

nleaves int Number of leaves in the hierarchical tree

nconnectedcomponents int The estimated number of connected components in the graph

children arraylike shape nnodes1 2 The children of each nonleaf node Values less than nfeatures correspond to leaves of the tree which are the original samples A node 63sklearncluster Clustering 1487

scikitlearn user guide Release 0213

igreater than or equal to nfeatures is a nonleaf node and has children childreni
nfeatures. Alternatively at the ith iteration childreni0 and childreni1 are
merged to form node nfeatures i

Fit the hierarchical clustering on the data

Parameters

Xarraylike shape nsamples nfeatures The data

ylgnored

Returns

self

fittransform selfXyNone fitparams

Fit to data then transform it

Fits transformer to X and y with optional parameters fitparams and returns a transformed version of X

Parameters

Xnumpy array of shape nsamples nfeatures Training set

scikitlearn user guide Release 0213

numpy array of shape nsamples Target values

Returns

Xnew numpy array of shape nsamples nfeaturesnew Transformed array

getparams selfdeepTrue

Get parameters for this estimator

Parameters

deep boolean optional If True will return the parameters for this estimator and contained

subobjects that are estimators

Returns

params mapping of string to any Parameter names mapped to their values

inversetransform selfXred

Inverse the transformation Return a vector of size nbfeatures with the values of Xred assigned to each

group of features

Parameters

Xred arraylike shapensamples nclusters or nclusters The values to be assigned

to each cluster of samples

Returns

Xarray shapensamples nfeatures or nfeatures A vector of size nsamples with

the values of Xred assigned to each of the cluster of samples

poolingfunc aaxisNone dtypeNone outNone keepdimsno value

Compute the arithmetic mean along the specified axis

Returns the average of the array elements The average is taken over the flattened array by default other

wise over the specified axis float64 intermediate and return values are used for integer inputs

Parameters

aarraylike Array containing numbers whose mean is desired If ais not an array a

conversion is attempted

axis None or int or tuple of ints optional Axis or axes along which the means are com

puted The default is to compute the mean of the flattened array

New in version 170

If this is a tuple of ints a mean is performed over multiple axes instead of a single axis or

all the axes as before

dtype datatype optional Type to use in computing the mean For integer inputs the

default isfloat64 for floating point inputs it is the same as the input dtype

out ndarray optional Alternate output array in which to place the result The default is

None if provided it must have the same shape as the expected output but the type will

be cast if necessary See docufuncs for details

keepdims bool optional If this is set to True the axes which are reduced are left in the

result as dimensions with size one With this option the result will broadcast correctly

against the input array

If the default value is passed then keepdims will not be passed through to the mean

method of subclasses of ndarray however any nondefault value will be If the sub

class' method does not implement keepdims any exceptions will be raised

63sklearncluster Clustering 1489

scikitlearn user guide Release 0213

Returns

array see dtype parameter above If out=None returns a new array containing the mean values otherwise a reference to the output array is returned

See also

average Weighted average

stdvarnanmean nanstd nanvar

Notes

The arithmetic mean is the sum of the elements along the axis divided by the number of elements

Note that for floatingpoint input the mean is computed using the same precision the input has Depending on the input data this can cause the results to be inaccurate especially for float32 see example below

Specifying a higherprecision accumulator using the dtype keyword can alleviate this issue

By default float16 results are computed using float32 intermediates for extra precision

Examples

```
a = np.array(1 2 3 4)
```

```
np.mean(a)
```

```
2.5
```

```
np.mean(a, axis=0)
```

```
array(2.5)
```

```
np.mean(a, axis=1)
```

```
array(15. 35)
```

In single precision mean can be inaccurate

```
a = np.zeros(2, dtype=np.float32)
```

```
a[0] = 10
```

```
a[1] = 0.1
```

```
np.mean(a)
```

```
0.549999924
```

Computing the mean in float64 is more accurate

```
np.mean(a, dtype=np.float64)
```

```
0.550000000074505806
```

```
set_params(self, params)
```

Set the parameters of this estimator

The method works on simple estimators as well as on nested objects such as pipelines The latter have parameters of the form componentparameter so that it's possible to update each component

of a nested object

Returns

self

transform self.X

Transform a new matrix using the built clustering

1490 Chapter 6 API (Application Programming Interface) Reference

scikitlearn user guide Release 0213

Parameters

Xarraylike shape nsamples nfeatures or nfeatures A M by N array of M obser-
vations in N dimensions or a length M array of M onedimensional observations

Returns

Yarray shape nsamples nclusters or nclusters The pooled values for each feature
cluster

Examples using sklearnclusterFeatureAgglomeration

•Feature agglomeration

•Feature agglomeration vs univariate selection

sklearncluster KMeans

classsklearncluster KMeansnclusters8 init'kmeans' ninit10 maxiter300

tol0.00001 precomputeddistances'auto' verbose0 ran-
domstateNone copyxTrue njobsNone algorithm'auto'

KMeans clustering

Read more in the User Guide

Parameters

nclusters int optional default 8 The number of clusters to form as well as the number of
centroids to generate

init 'kmeans' 'random' or an ndarray Method for initialization defaults to 'k-
means'

'kmeans' selects initial cluster centers for kmean clustering in a smart way to speed
up convergence See section Notes in kinit for more details

'random' choose k observations rows at random from data for the initial centroids

If an ndarray is passed it should be of shape nclusters nfeatures and gives the initial
centers

ninit int default 10 Number of time the kmeans algorithm will be run with different cen-
troid seeds The final results will be the best output of ninit consecutive runs in terms of

inertia
maxiter int default 300 Maximum number of iterations of the kmeans algorithm for a
single run

tolfloat default 1e4 Relative tolerance with regards to inertia to declare convergence

precomputeddistances 'auto' True False Precompute distances faster but takes more
memory

'auto' do not precompute distances if nsamples nclusters 12 million This corre-
sponds to about 100MB overhead per job using double precision

True always precompute distances

False never precompute distances

verbose int default 0 Verbosity mode

63sklearncluster Clustering 1491

scikitlearn user guide Release 0213

randomstate int RandomState instance or None default Determines random number generation for centroid initialization Use an int to make the randomness deterministic See Glossary

copyx boolean optional When precomputing distances it is more numerically accurate to center the data first If copyx is True default then the original data is not modified ensuring X is Ccontiguous If False the original data is modified and put back before the function returns but small numerical differences may be introduced by subtracting and then adding the data mean in this case it will also not ensure that data is Ccontiguous which may cause a significant slowdown

njobs int or None optional defaultNone The number of jobs to use for the computation This works by computing each of the ninit runs in parallel

None means 1 unless in a joblibparallelbackend context1means using all processors See Glossary for more details

algorithm “auto” “full” or “elkan” default“auto” Kmeans algorithm to use The classical EMstyle algorithm is “full” The “elkan” variation is more efficient by using the triangle inequality but currently doesn’t support sparse data “auto” chooses “elkan” for dense data and “full” for sparse data

Attributes

clustercenters array nclusters nfeatures Coordinates of cluster centers If the algorithm stops before fully converging see tol andmaxiter these will not be consistent withlabels

labels Labels of each point

inertia float Sum of squared distances of samples to their closest cluster center

niter int Number of iterations run

See also

MiniBatchKMeans Alternative online implementation that does incremental updates of the centers positions using minibatches For large scale learning say nsamples 10k MiniBatchKMeans is probably much faster than the default batch implementation

Notes

The kmeans problem is solved using either Lloyd’s or Elkan’s algorithm

The average complexity is given by $O(knT)$ where n is the number of samples and T is the number of iteration

The worst case complexity is given by $O(nk^2p)$ with n nsamples p nfeatures D Arthur and S

Vassilvitskii ‘How slow is the kmeans method’ SoCG2006

In practice the kmeans algorithm is very fast one of the fastest clustering algorithms available but it falls in local minima That’s why it can be useful to restart it several times

If the algorithm stops before fully converging because of tol ormaxiter labels and clustercenters will not be consistent ie the clustercenters will not be the means of the points in each cluster Also the estimator will reassign labels after the last iteration to make labels consistent with predict on the training set

transform(self, X) Transform X to a cluster distance space
init(self, nclusters=8, init='kmeans', ninit=10, maxiter=300, tol=0.00001, precompute_distances='auto', verbose=0, randomstate=None, copy_x=True, n_jobs=None, algorithm='auto')
fit(self, X, y, sample_weight=None) Compute kmeans clustering
```

Parameters

X arraylike or sparse matrix shape (n_samples, n_features) Training instances to cluster
It must be noted that the data will be converted to C ordering which will cause a memory copy if the given data is not C contiguous
y ignored not used present here for API (Application Programming Interface) consistency by convention
sample_weight arraylike shape (n_samples,) optional The weights for each observation in X If None all observations are assigned equal weight default None
fit_predict(self, X, y, sample_weight=None) Compute cluster centers and predict cluster index for each sample
Convenience method equivalent to calling fit(X) followed by predict(X)
Parameters
X arraylike sparse matrix shape (n_samples, n_features) New data to transform
y ignored not used present here for API (Application Programming Interface) consistency by convention

scikitlearn user guide Release 0213

sampleweight arraylike shape nsamples optional The weights for each observation in X If None all observations are assigned equal weight default None

Returns

labels array shape nsamples Index of the cluster each sample belongs to

fittransform selfXyNone sampleweightNone

Compute clustering and transform X to clusterdistance space

Equivalent to fitXtransformX but more efficiently implemented

Parameters

Xarraylike sparse matrix shape nsamples nfeatures New data to transform

ylgnored not used present here for API (Application Programming Interface) consistency by convention

sampleweight arraylike shape nsamples optional The weights for each observation in X If None all observations are assigned equal weight default None

Returns

Xnew array shape nsamples k X transformed in the new space

getparams selfdeepTrue

Get parameters for this estimator

Parameters

deep boolean optional If True will return the parameters for this estimator and contained

subobjects that are estimators

Returns

params mapping of string to any Parameter names mapped to their values

predictselfXsampleweightNone

Predict the closest cluster each sample in X belongs to

In the vector quantization literature clustercenters is called the code book and each value re

turned bypredict is the index of the closest code in the code book

Parameters

Xarraylike sparse matrix shape nsamples nfeatures New data to predict

sampleweight arraylike shape nsamples optional The weights for each observation

in X If None all observations are assigned equal weight default None

Returns

labels array shape nsamples Index of the cluster each sample belongs to

scoreselfXyNone sampleweightNone

Opposite of the value of X on the Kmeans objective

Parameters

Xarraylike sparse matrix shape nsamples nfeatures New data

ylgnored not used present here for API (Application Programming Interface) consistency by convention

sampleweight arraylike shape nsamples optional The weights for each observation

in X If None all observations are assigned equal weight default None

Returns

1494 Chapter 6 API (Application Programming Interface) Reference

scikitlearn user guide Release 0213

score float Opposite of the value of X on the Kmeans objective

setparams selfparams

Set the parameters of this estimator

The method works on simple estimators as well as on nested objects such as pipelines The latter have parameters of the form componentparameter so that it's possible to update each component of a nested object

Returns

self

transform selfX

Transform X to a clusterdistance space

In the new space each dimension is the distance to the cluster centers Note that even if X is sparse the array returned by transform will typically be dense

Parameters

Xarraylike sparse matrix shape nsamples nfeatures New data to transform

Returns

Xnew array shape nsamples k X transformed in the new space

sklearncluster MiniBatchKMeans

classsklearncluster MiniBatchKMeans nclusters8 init'kmeans' maxiter100

batchsize100 verbose0 computelabelsTrue

randomstateNone tol00 maxnoimprovement10

initsizeNone ninit3 reassignmentratio001

MiniBatch KMeans clustering

Read more in the User Guide

Parameters

nclusters int optional default 8 The number of clusters to form as well as the number of centroids to generate

63sklearncluster Clustering 1495

scikitlearn user guide Release 0213

init 'kmeans' 'random' or an ndarray default 'kmeans' Method for initialization defaults to 'kmeans'

'kmeans' selects initial cluster centers for kmean clustering in a smart way to speed up convergence See section Notes in kinit for more details

'random' choose k observations rows at random from data for the initial centroids

If an ndarray is passed it should be of shape nclusters nfeatures and gives the initial centers

maxiter int optional Maximum number of iterations over the complete dataset before stopping independently of any early stopping criterion heuristics

batchsize int optional default 100 Size of the mini batches

verbose boolean optional Verbosity mode

computelabels boolean default True Compute label assignment and inertia for the complete dataset once the minibatch optimization has converged in fit

randomstate int RandomState instance or None default Determines random number generation for centroid initialization and random reassignment Use an int to make the randomness deterministic See Glossary

tol float default 0.0 Control early stopping based on the relative center changes as measured by a smoothed variancenormalized of the mean center squared position changes This early stopping heuristics is closer to the one used for the batch variant of the algorithms but induces a slight computational and memory overhead over the inertia heuristic

To disable convergence detection based on normalized center change set tol to 0.0 default

maxnoimprovement int default 10 Control early stopping based on the consecutive number of mini batches that does not yield an improvement on the smoothed inertia

To disable convergence detection based on inertia set maxnoimprovement to None

initsize int optional default 3 batchsize Number of samples to randomly sample for speeding up the initialization sometimes at the expense of accuracy the only algorithm is initialized by running a batch KMeans on a random subset of the data This needs to be larger than nclusters

ninit int default 3 Number of random initializations that are tried In contrast to KMeans the algorithm is only run once using the best of the ninit initializations as measured by inertia

reassignmentratio float default 0.01 Control the fraction of the maximum number of counts for a center to be reassigned A higher value means that low count centers are more easily reassigned which means that the model will take longer to converge but should converge in a better clustering

Attributes

clustercenters array nclusters nfeatures Coordinates of cluster centers

labels Labels of each point if computelabels is set to True

inertia float The value of the inertia criterion associated with the chosen partition if computelabels is set to True The inertia is defined as the sum of square distances of samples to their nearest neighbor

KMeans The classic implementation of the clustering method based on the Lloyd’s algorithm It consumes the whole set of input data at each iteration

Notes

See <https://www.weecstufstedudsculleypapersfastkmeanspdf>

Examples

```
from sklearn.cluster import MiniBatchKMeans
import numpy as np
X = np.array([2, 1, 4, 1, 0,
               4, 2, 4, 0, 4, 4,
               4, 5, 0, 1, 2, 2,
               3, 2, 5, 5, 1, 1])
```

manually fit on batches

```
kmeans = MiniBatchKMeans(n_clusters=2,
                           random_state=0,
                           batch_size=6)
kmeans.fit(X)
kmeans.predict(X)
kmeans.cluster_centers_
array([1, 3, 4])
```

fit on the whole data

```
kmeans = MiniBatchKMeans(n_clusters=2,
                           random_state=0,
                           batch_size=6,
                           max_iter=10)
kmeans.fit(X)
kmeans.predict(X)
array([0, 4, 4])
```

Methods

- fit(self, X, y=None, sample_weight=None) Compute the centroids on X by chunking it into mini batches
- fit_predict(self, X, y=None, sample_weight=None) Compute cluster centers and predict cluster index for each sample

sklearncluster MeanShift

classssklearncluster MeanShift bandwidthNone seedsNone binseedingFalse

minbinfreq1 clusterallTrue njobsNone

Mean shift clustering using a flat kernel

Mean shift clustering aims to discover “blobs” in a smooth density of samples It is a centroidbased algorithm which works by updating candidates for centroids to be the mean of the points within a given region These candidates are then filtered in a postprocessing stage to eliminate nearduplicates to form the final set of centroids

Seeding is performed using a binning technique for scalability

Read more in the User Guide

Parameters

bandwidth float optional Bandwidth used in the RBF (Radial Basis Function) kernel

If not given the bandwidth is estimated using sklearnclusterestimatebandwidth see the documentation for that function for hints on scalability see also the Notes below

seeds array shapensamples nfeatures optional Seeds used to initialize kernels If not set the seeds are calculated by clusteringgetbinseeds with bandwidth as the grid size and default values for other parameters

binseeding boolean optional If true initial kernel locations are not locations of all points but rather the location of the discretized version of points where points are binned onto a grid whose coarseness corresponds to the bandwidth Setting this option to True will speed up the algorithm because fewer seeds will be initialized default value False Ignored if seeds argument is not None

minbinfreq int optional To speed up the algorithm accept only those bins with at least minbinfreq points as seeds If not defined set to 1

clusterall boolean default True If true then all points are clustered even those orphans that are not within any kernel Orphans are assigned to the nearest kernel If false then orphans are given cluster label 1

njobs int or None optional defaultNone The number of jobs to use for the computation

This works by computing each of the ninit runs in parallel

None means 1 unless in a joblibparallelbackend context1means using all processors See Glossary for more details

1500 Chapter 6 API (Application Programming Interface) Reference

scikitlearn user guide Release 0213

Attributes

clustercenters array nclusters nfeatures Coordinates of cluster centers

labels Labels of each point

Notes

Scalability

Because this implementation uses a flat kernel and a Ball Tree to look up members of each kernel the complexity will tend towards $OTn \log n$ in lower dimensions with n the number of samples and T the number of points

In higher dimensions the complexity will tend towards OTn^2

Scalability can be boosted by using fewer seeds for example by using a higher value of minbinfreq in the getbinseeds function

Note that the estimatebandwidth function is much less scalable than the mean shift algorithm and will be the bottleneck if it is used

Parameters

Xndarray shape nsamples nfeatures Input data

ylgnored not used present for API (Application Programming Interface) consistency by convention

Returns

labels ndarray shape nsamples cluster labels

getparams selfdeepTrue

Get parameters for this estimator

Parameters

deep boolean optional If True will return the parameters for this estimator and contained

subobjects that are estimators

Returns

params mapping of string to any Parameter names mapped to their values

predictselfX

Predict the closest cluster each sample in X belongs to

Parameters

Xarraylike sparse matrix shapensamples nfeatures New data to predict

Returns

labels array shape nsamples Index of the cluster each sample belongs to

setparams selfparams

Set the parameters of this estimator

The method works on simple estimators as well as on nested objects such as pipelines The latter have

parameters of the form componentparameter so that it's possible to update each component

of a nested object

Returns

self

Examples using sklearnclusterMeanShift

sklearncluster SpectralClustering

class sklearncluster SpectralClustering nclusters8 eigensolverNone ran

domstateNone ninit10 gamma10 affin

ity'rbf' nneighbors10 eigentol00 as

signlabels'kmeans' degree3 coef01 ker

nelparamsNone njobsNone

Apply clustering to a projection of the normalized Laplacian

In practice Spectral Clustering is very useful when the structure of the individual clusters is highly nonconvex or more generally when a measure of the center and spread of the cluster is not a suitable description of the complete cluster For instance when clusters are nested circles on the 2D plane

If affinity is the adjacency matrix of a graph this method can be used to find normalized graph cuts

When calling fit an affinity matrix is constructed using either kernel function such the Gaussian aka RBF (Radial Basis Function) kernel of the euclidean distanced dX X

npexpgamma dXX2

or a knearest neighbors connectivity matrix

Alternatively using precomputed a userprovided affinity matrix can be used

Read more in the User Guide

Parameters

nclusters integer optional The dimension of the projection subspace

eigensolver None 'arpack' 'lobpcg' or 'amg' The eigenvalue decomposition strategy to use AMG requires pyamg to be installed It can be faster on very large sparse problems but may also lead to instabilities

randomstate int RandomState instance or None default A pseudo random number generator used for the initialization of the lobpcg eigen vectors decomposition when eigensolveramg and by the KMeans initialization Use an int to make the ran

domness deterministic See Glossary

ninit int optional default 10 Number of time the kmeans algorithm will be run with dif

ferent centroid seeds The final results will be the best output of ninit consecutive runs in

terms of inertia

gamma float default10 Kernel coefficient for rbf poly sigmoid laplacian and chi2 kernels

Ignored for affinitynearestneighbors

affinity string arraylike or callable default 'rbf' If a string this may be one of 'near

estneighbors' 'precomputed' 'rbf' or one of the kernels supported by sklearn

metricspairwise kernels

Only kernels that produce similarity scores nonnegative values that increase with similar

ity should be used This property is not checked by the clustering algorithm

nneighbors integer Number of neighbors to use when constructing the affinity matrix using

the nearest neighbors method Ignored for affinityrbf

eigentol float optional default 00 Stopping criterion for eigendecomposition of the Lapla

cian matrix when eigensolverarpack

assignlabels 'kmeans' 'discretize' default 'kmeans' The strategy to use to assign labels

in the embedding space There are two ways to assign labels after the laplacian embedding

63sklearncluster Clustering 1503

scikitlearn user guide Release 0213

kmeans can be applied and is a popular choice But it can also be sensitive to initialization

Discretization is another approach which is less sensitive to random initialization

degree float default3 Degree of the polynomial kernel Ignored by other kernels

coef0 float default1 Zero coefficient for polynomial and sigmoid kernels Ignored by other kernels

kernelparams dictionary of string to any optional Parameters keyword arguments and values for kernel passed as callable object Ignored by other kernels

njobs int or None optional defaultNone The number of parallel jobs to run None means

1 unless in a joblibparallelbackend context1means using all processors See

Glossary for more details

Attributes

affinitymatrix arraylike shape nsamples nsamples Affinity matrix used for cluster

ing Available only if after calling fit

labels Labels of each point

Notes

If you have an affinity matrix such as a distance matrix for which 0 means identical elements and high values

means very dissimilar elements it can be transformed in a similarity matrix that is well suited for the algorithm

by applying the Gaussian RBF (Radial Basis Function) heat kernel

npexp distmatrix 2 2 delta2

Wheredelta is a free parameter representing the width of the Gaussian kernel

Another alternative is to take a symmetric version of the k nearest neighbors connectivity matrix of the points

If the pyamg package is installed it is used this greatly speeds up computation

boseFalse returnniterFalse

Perform Affinity Propagation Clustering of data

Read more in the User Guide

Parameters

Sarraylike shape nsamples nsamples Matrix of similarities between points

preference arraylike shape nsamples or float optional Preferences for each point points

with larger values of preferences are more likely to be chosen as exemplars The number of

exemplars ie of clusters is influenced by the input preferences value If the preferences

are not passed as arguments they will be set to the median of the input similarities resulting

in a moderate number of clusters For a smaller amount of clusters this can be set to the

minimum value of the similarities

convergenceiter int optional default 15 Number of iterations with no change in the number

of estimated clusters that stops the convergence

maxiter int optional default 200 Maximum number of iterations

1506 Chapter 6 API (Application Programming Interface) Reference

scikitlearn user guide Release 0213

damping float optional default 0.5 Damping factor between 0.5 and 1

copy boolean optional default True If copy is False the affinity matrix is modified inplace by the algorithm for memory efficiency

verbose boolean optional default False The verbosity level

return_niter bool default False Whether or not to return the number of iterations

Returns

cluster_centers indices array shape n_clusters index of clusters centers

labels array shape n_samples cluster labels for each point

niter int number of iterations run Returned only if return_niter is set to True

Notes

For an example see examples/cluster/plot_affinity_propagation.py

When the algorithm does not converge it returns an empty array as cluster_centers and 1 as label for each training sample

When all training samples have equal similarities and equal preferences the assignment of cluster centers and labels depends on the preference. If the preference is smaller than the similarities a single cluster center and label 0 for every sample will be returned. Otherwise every training sample becomes its own cluster center and is assigned a unique label.

Read more in the User Guide

1508 Chapter 6 API (Application Programming Interface) Reference

Parameters

Xarray shape nsamples nfeatures or nsamples nsamples if metric='precomputed'

A feature array or array of distances between samples if metric='precomputed'

minsamples int 1 or float between 0 and 1 The number of samples in a neighborhood for a point to be considered as a core point Expressed as an absolute number or a fraction of the number of samples rounded to be at least 2

maxeps float optional default npinf The maximum distance between two samples for one to be considered as in the neighborhood of the other Default value of npinf will identify clusters across all scales reducing maxeps will result in shorter run times

metric string or callable optional default 'minkowski' Metric to use for distance computation Any metric from scikitlearn or scipyspatialdistance can be used

If metric is a callable function it is called on each pair of instances rows and the resulting value recorded The callable should take two arrays as input and return one value indicating the distance between them This works for Scipy's metrics but is less efficient than passing the metric name as a string If metric is "precomputed" X is assumed to be a distance matrix and must be square

Valid values for metric are

- from scikitlearn 'cityblock' 'cosine' 'euclidean' 'l1' 'l2' 'manhattan'
- from scipyspatialdistance 'braycurtis' 'canberra' 'chebyshev' 'correlation' 'dice' 'hamming' 'jaccard' 'kulsinski' 'mahalanobis' 'minkowski' 'rogerstanimoto' 'rusellrao' 'seuclidean' 'sokalmichener' 'sokalsneath' 'sqeuclidean' 'yule'

See the documentation for scipyspatialdistance for details on these metrics

p integer optional default 2 Parameter for the Minkowski metric from sklearn metricspairwisel1distances When p 1 this is equivalent to using manhattan distance l1 and euclidean distance l2 for p 2 For arbitrary p minkowski distance lp is used

metricparams dict optional default None Additional keyword arguments for the metric function

algorithm 'auto' 'balltree' 'kdtree' 'brute' optional Algorithm used to compute the nearest neighbors

- 'balltree' will use BallTree
- 'kdtree' will use KDTree
- 'brute' will use a brute force search
- 'auto' will attempt to decide the most appropriate algorithm based on the values passed

tofit method default

Note fitting on sparse input will override the setting of this parameter using brute force

leafsize int optional default 30 Leaf size passed to BallTree or KDTree This can affect the speed of the construction and query as well as the memory required to store the tree The optimal value depends on the nature of the problem

njobs int or None optional default None The number of parallel jobs to run for neighbors

search None means 1 unless in a joblibparallelbackend context 1 means using all processors See Glossary for more details

Returns

63sklearncluster Clustering 1509

scikitlearn user guide Release 0213

labels array nsamples Cluster labels for each point Noisy samples are given the label 1

See also

DBSCAN An estimator interface for this clustering algorithm

OPTICS A similar estimator interface clustering at multiple values of eps Our implementation is optimized for memory usage

Notes

For an example see examplesclusterplotdbscanpy

This implementation bulkcomputes all neighborhood queries which increases the memory complexity to

On d where d is the average number of neighbors while original DBSCAN had memory complexity On

It may attract a higher memory complexity when querying these nearest neighborhoods depending on the algorithm

One way to avoid the query complexity is to precompute sparse neighborhoods in chunks

usingNearestNeighborsradiusneighborsgraph withmodedistance then using

metricprecomputed here

Another way to reduce memory and computation time is to remove nearduplicate points and use

sampleweight instead

clusteroptics provides a similar clustering with lower memory usage

rithm'auto' returnniterFalse
Kmeans clustering algorithm
Read more in the User Guide

Parameters

Xarraylike or sparse matrix shape nsamples nfeatures The observations to cluster It must be noted that the data will be converted to C ordering which will cause a memory copy if the given data is not Ccontiguous
nclusters int The number of clusters to form as well as the number of centroids to generate
sampleweight arraylike shape nsamples optional The weights for each observation in X If None all observations are assigned equal weight default None
init 'kmeans' 'random' or ndarray or a callable optional Method for initialization default to 'kmeans'
'kmeans' selects initial cluster centers for kmean clustering in a smart way to speed up convergence See section Notes in kinit for more details
'random' choose k observations rows at random from data for the initial centroids
If an ndarray is passed it should be of shape nclusters nfeatures and gives the initial centers
If a callable is passed it should take arguments X k and and a random state and return an initialization

scikitlearn user guide Release 0213

precomputeddistances 'auto' True False Precompute distances faster but takes more memory

'auto' do not precompute distances if nsamples nclusters 12 million This corresponds to about 100MB overhead per job using double precision

True always precompute distances

False never precompute distances

ninit int optional default 10 Number of time the kmeans algorithm will be run with different centroid seeds The final results will be the best output of ninit consecutive runs in terms of inertia

maxiter int optional default 300 Maximum number of iterations of the kmeans algorithm to run

verbose boolean optional Verbosity mode

tolfloat optional The relative increment in the results before declaring convergence

randomstate int RandomState instance or None default Determines random number generation for centroid initialization Use an int to make the randomness deterministic See Glossary

copyx boolean optional When precomputing distances it is more numerically accurate to center the data first If copyx is True default then the original data is not modified ensuring X is Ccontiguous If False the original data is modified and put back before the function returns but small numerical differences may be introduced by subtracting and then adding the data mean in this case it will also not ensure that data is Ccontiguous which may cause a significant slowdown

njobs int or None optional defaultNone The number of jobs to use for the computation This works by computing each of the ninit runs in parallel

None means 1 unless in a joblibparallelbackend context1means using all

processors See Glossary for more details

algorithm "auto" "full" or "elkan" default"auto" Kmeans algorithm to use The classical EMstyle algorithm is "full" The "elkan" variation is more efficient by using the triangle inequality but currently doesn't support sparse data "auto" chooses "elkan" for dense data and "full" for sparse data

returnniter bool optional Whether or not to return the number of iterations

Returns

centroid float ndarray with shape k nfeatures Centroids found at the last iteration of k means

label integer ndarray with shape nsamples labeli is the code or index of the centroid the i'th observation is closest to

inertia float The final value of the inertia criterion sum of squared distances to the closest centroid for all observations in the training set

bestniter int Number of iterations corresponding to the best results Returned only if returnniter is set to True

sklearncluster spectralclustering

sklearncluster spectralclustering affinity nclusters8 ncomponentsNone

eigensolverNone randomstateNone ninit10

eigentol00 assignlabels'kmeans'

Apply clustering to a projection of the normalized Laplacian

In practice Spectral Clustering is very useful when the structure of the individual clusters is highly nonconvex or more generally when a measure of the center and spread of the cluster is not a suitable description of the complete cluster For instance when clusters are nested circles on the 2D plane

If affinity is the adjacency matrix of a graph this method can be used to find normalized graph cuts

Read more in the User Guide

Parameters

affinity arraylike or sparse matrix shape nsamples nsamples The affinity matrix describing the relationship of the samples to embed Must be symmetric

Possible examples

- adjacency matrix of a graph
- heat kernel of the pairwise distance matrix of the samples
- symmetric knearest neighbours connectivity matrix of the samples

nclusters integer optional Number of clusters to extract

ncomponents integer optional default is nclusters Number of eigen vectors to use for the spectral embedding

eigensolver None 'arpack' 'lobpcg' or 'amg' The eigenvalue decomposition strategy to use AMG requires pyamg to be installed It can be faster on very large sparse problems but may also lead to instabilities

randomstate int RandomState instance or None default A pseudo random number generator used for the initialization of the lobpcg eigen vectors decomposition when eigensolver 'amg' and by the KMeans initialization Use an int to make the randomness deterministic See Glossary

ninit int optional default 10 Number of time the kmeans algorithm will be run with different centroid seeds The final results will be the best output of ninit consecutive runs in terms of inertia

eigentol float optional default 00 Stopping criterion for eigendecomposition of the Laplacian matrix when using arpack eigensolver

assignlabels 'kmeans' 'discretize' default 'kmeans' The strategy to use to assign labels in the embedding space There are two ways to assign labels after the laplacian embedding kmeans can be applied and is a popular choice But it can also be sensitive to initialization Discretization is another approach which is less sensitive to random initialization See the 'Multiclass spectral clustering' paper referenced below for more details on the discretization approach

Returns

labels array of integers shape nsamples The labels of the clusters

63sklearncluster Clustering 1515

scikitlearn user guide Release 0213

Notes

The graph should contain only one connect component elsewhere the results make little sense
This algorithm solves the normalized cut for k2 it is a normalized spectral clustering

sklearn.cluster.WardTree

sklearn.cluster.WardTree(X, connectivity=None, n_clusters=None, return_distance=False)

Ward clustering based on a Feature matrix

Recursively merges the pair of clusters that minimally increases within cluster variance

The inertia matrix uses a Heapq-based representation

This is the structured version that takes into account some topological structure between samples

Read more in the User Guide

Parameters

X: array shape (n_samples, n_features) feature matrix representing n_samples samples to be clustered

connectivity: sparse matrix optional connectivity matrix Defines for each sample the neighboring samples following a given structure of the data The matrix is assumed to be symmetric and only the upper triangular half is used Default is None ie the Ward algorithm is unstructured

n_clusters: int optional Stop early the construction of the tree at n_clusters This is useful to decrease computation time if the number of clusters is not small compared to the number of samples In this case the complete tree is not computed thus the ‘children’ output is of limited use and the ‘parents’ output should rather be used This option is valid only when specifying a connectivity matrix

return_distance: bool optional If True return the distance between the clusters

Returns

1516 Chapter 6 API (Application Programming Interface) Reference

scikitlearn user guide Release 0213

children 2D array shape nnodes1 2 The children of each nonleaf node Values less than nsamples correspond to leaves of the tree which are the original samples A node igreater than or equal to nsamples is a nonleaf node and has children childreni nsamples Alternatively at the ith iteration childreni0 and childreni1 are merged to form node nsamples i
nconnectedcomponents int The number of connected components in the graph
nleaves int The number of leaves in the tree
parents 1D array shape nnodes or None The parent of each node Only returned when a connectivity matrix is specified elsewhere 'None' is returned
distances 1D array shape nnodes1 Only returned if returndistance is set to True for compatibility The distances between the centers of the nodes distancesi corresponds to a weighted euclidean distance between the nodes childreni 1 and childreni 2 If the nodes refer to leaves of the tree then distancesi is their unweighted euclidean distance Distances are updated in the following way from scipyhierarchylinkage

The new entry d_{i+1} is computed as follows

$$d_{i+1} = \sqrt{\frac{d_{i+1,0}^2 + d_{i+1,1}^2}{2} - \frac{d_{i+1,0}^2 + d_{i+1,1}^2}{2}}$$

where d_{i+1} is the newly joined cluster consisting of clusters $d_{i+1,0}$ and $d_{i+1,1}$ is an unused cluster in the forest $d_{i+1,0}$ and $d_{i+1,1}$ is the cardinality of its argument This is also known as the incremental algorithm

Spectral biclustering Kluger 2003

64sklearnclusterbicluster Biclustering 1517

scikitlearn user guide Release 0213

Partitions rows and columns under the assumption that the data has an underlying checkerboard structure For instance if there are two row partitions and three column partitions each row will belong to three biclusters and each column will belong to two biclusters The outer product of the corresponding row and column label vectors gives this checkerboard structure

Read more in the User Guide

Parameters

nclusters integer or tuple nrowclusters ncolumnclusters The number of row and column clusters in the checkerboard structure

method string optional default 'bistochastic' Method of normalizing and converting singular vectors into biclusters May be one of 'scale' 'bistochastic' or 'log' The authors recommend using 'log' If the data is sparse however log normalization will not work which is why the default is 'bistochastic' CAUTION if methodlog the data must not be sparse

ncomponents integer optional default 6 Number of singular vectors to check

nbest integer optional default 3 Number of best singular vectors to which to project the data for clustering

svdmethod string optional default 'randomized' Selects the algorithm for finding singular vectors May be 'randomized' or 'arpack' If 'randomized' uses sklearnutils extmathrandomizedsvd which may be faster for large matrices If 'arpack' uses scipysparselinalgsvds which is more accurate but possibly slower in some cases

nsvdvecs int optional default None Number of vectors to use in calculating the SVD Corresponds to ncv whensvdmethodarpack andnoversamples when svdmethod is 'randomized'

minibatch bool optional default False Whether to use minibatch kmeans which is faster but may get different results

init 'kmeans' 'random' or an ndarray Method for initialization of kmeans algorithm defaults to 'kmeans'

ninit int optional default 10 Number of random initializations that are tried with the k means algorithm

If minibatch kmeans is used the best initialization is chosen and the algorithm runs once Otherwise the algorithm is run for each initialization and the best solution chosen

njobs int or None optional defaultNone The number of jobs to use for the computation This works by breaking down the pairwise matrix into njobs even slices and computing them in parallel

None means 1 unless in a joblibparallelbackend context1means using all processors See Glossary for more details

randomstate int RandomState instance or None default Used for randomizing the singular value decomposition and the kmeans initialization Use an int to make the randomness deterministic See Glossary

Spectral CoClustering algorithm Dhillon 2001

Clusters rows and columns of an array Xto solve the relaxed normalized cut of the bipartite graph created from

Xas follows the edge between row vertex iand column vertex jhas weight X_{ij}

The resulting bicluster structure is blockdiagonal since each row and each column belongs to exactly one

bicluster

Supports sparse matrices as long as they are nonnegative

Read more in the User Guide

Parameters

nclusters integer optional default 3 The number of biclusters to find

svdmethod string optional default 'randomized' Selects the algorithm for finding singu

lar vectors May be 'randomized' or 'arpack' If 'randomized' use sklearnutils

extmathrandomizedsvd which may be faster for large matrices If 'arpack' use

scipysparselinalgsvds which is more accurate but possibly slower in some

cases

nsvdvecs int optional default None Number of vectors to use in calculating the

SVD Corresponds to ncv whensvdmethodarpack andnoversamples when

svdmethod is 'randomized'

minibatch bool optional default False Whether to use minibatch kmeans which is faster

but may get different results

init 'kmeans' 'random' or an ndarray Method for initialization of kmeans algorithm

defaults to 'kmeans'

ninit int optional default 10 Number of random initializations that are tried with the k

means algorithm

If minibatch kmeans is used the best initialization is chosen and the algorithm runs once

Otherwise the algorithm is run for each initialization and the best solution chosen

njobs int or None optional defaultNone The number of jobs to use for the computation

This works by breaking down the pairwise matrix into njobs even slices and computing

them in parallel

None means 1 unless in a joblibparallelbackend context1means using all

processors See Glossary for more details

randomstate int RandomState instance or None default Used for randomizing the singular

value decomposition and the kmeans initialization Use an int to make the randomness

deterministic See Glossary

64sklearnclusterbicluster Biclustering 1523

scikitlearn user guide Release 0213

65sklearncompose Composite Estimators

Metaestimators for building composite models with transformers

In addition to its current contents this module will eventually be home to refurbished versions of Pipeline and FeatureUnion

User guide See the Pipelines and composite estimators section for further details

composeColumnTransformer transformers Applies transformers to columns of an array or pandas DataFrame

composeTransformedTargetRegressor Metaestimator to regress on a transformed target

651sklearncompose ColumnTransformer

classsklearncompose ColumnTransformer transformers remainder'drop'

sparsethreshold03 njobsNone trans

formerweightsNone verboseFalse

Applies transformers to columns of an array or pandas DataFrame

This estimator allows different columns or column subsets of the input to be transformed separately and the features generated by each transformer will be concatenated to form a single feature space This is useful for heterogeneous or columnar data to combine several feature extraction mechanisms or transformations into a single transformer

Read more in the User Guide

New in version 020

Parameters

transformers list of tuples List of name transformer columns tuples specifying the transformer objects to be applied to subsets of the data

name string Like in Pipeline and FeatureUnion this allows the transformer and its parameters to be set using setparams and searched in grid search

transformer estimator or 'passthrough' 'drop' Estimator must support fit and

transform Specialcased strings 'drop' and 'passthrough' are accepted as well to

indicate to drop the columns or to pass them through untransformed respectively

columns string or int arraylike of string or int slice boolean mask array or callable

Indexes the data on its second axis Integers are interpreted as positional columns while

strings can reference DataFrame columns by name A scalar string or int should be used

wheretransformer expects X to be a 1d arraylike vector otherwise a 2d array will

be passed to the transformer A callable is passed the input data Xand can return any of the above

remainder 'drop' 'passthrough' or estimator default 'drop' By default only the

specified columns in transformers are transformed and combined in the output and

the nonspecified columns are dropped default of drop By specifying

remainderpassthrough all remaining columns that were not specified in trans

formers will be automatically passed through This subset of columns is concatenated with

the output of the transformers By setting remainder to be an estimator the remaining

nonspecified columns will use the remainder estimator The estimator must support fit

andtransform Note that using this feature requires that the DataFrame columns input at fit

andtransform have identical order

1524 Chapter 6 API (Application Programming Interface) Reference

scikitlearn user guide Release 0213

sparsethreshold float default 0.3 If the output of the different transformers contains sparse matrices these will be stacked as a sparse matrix if the overall density is lower than this value Usesparsethreshold0 to always return dense When the transformed output consists of all dense data the stacked result will be dense and this keyword will be ignored
njobs int or None optional defaultNone Number of jobs to run in parallel None means 1 unless in a joblibparallelbackend context1means using all processors See Glossary for more details

transformerweights dict optional Multiplicative weights for features per transformer The output of the transformer is multiplied by these weights Keys are transformer names values the weights

verbose boolean optionaldefaultFalse If True the time elapsed while fitting each transformer will be printed as it is completed

Attributes

transformers list The collection of fitted transformers as tuples of name fittedtransformer columnfittedtransformer can be an estimator 'drop' or 'passthrough' In case there were no columns selected this will be the unfitted transformer If there are remaining columns the final element is a tuple of the form 'remainder' transformer remainingcolumns corresponding to the remainder parameter If there are remaining columns then lentransformerslentransformers1 other wiselentransformerslentransformers

namedtransformers Bunch object a dictionary with attribute access Access the fitted transformer by name

sparseoutput boolean Boolean flag indicating whether the output of transform is a sparse matrix or a dense numpy array which depends on the output of the individual transformers and thesparsethreshold keyword

See also

sklearncomposemakecolumntransformer convenience function for combining the outputs of multiple transformer objects applied to column subsets of the original feature space

Notes

The order of the columns in the transformed feature matrix follows the order of how the columns are specified in the transformers list Columns of the original feature matrix that are not specified are dropped from the resulting transformed feature matrix unless specified in the passthrough keyword Those columns specified withpassthrough are added at the right to the output of the transformers

Examples

```
import numpy as np
from sklearncompose import ColumnTransformer
from sklearnpreprocessing import Normalizer
ct = ColumnTransformer(
    norm1 Normalizer(norml1=0.1)
    norm2 Normalizer(norml1=2)
X nparray0 1 2 2
1 1 0 1
Normalizer scales each row of X to unit norm A separate scaling
```

scikitlearn user guide Release 0213

is applied for the two first and two last elements of each row independently

ctffittransformX

array0 1 05 05

05 05 0 1

Methods

fitself X y Fit all transformers using X

fittransform self X y Fit all transformers transform the data and concatenate results

getfeaturenames self Get feature names from all transformers

getparams self deep Get parameters for this estimator

setparams self kwargs Set the parameters of this estimator

transform self X Transform X separately by each transformer concatenate results

init selftransformers remainder'drop' sparsethreshold03 njobsNone transformerweightsNone verboseFalse

fitselfXyNone

Fit all transformers using X

Parameters

Xarraylike or DataFrame of shape nsamples nfeatures Input data of which specified subsets are used to fit the transformers

yarraylike shape nsamples optional Targets for supervised learning

Returns

self ColumnTransformer This estimator

fittransform selfXyNone

Fit all transformers transform the data and concatenate results

Parameters

Xarraylike or DataFrame of shape nsamples nfeatures Input data of which specified subsets are used to fit the transformers

yarraylike shape nsamples optional Targets for supervised learning

Returns

Xt arraylike or sparse matrix shape nsamples sumncomponents hstack of results of transformers sumncomponents is the sum of ncomponents output dimension over transformers If any result is a sparse matrix everything will be converted to sparse matrices

getfeaturenames self

Get feature names from all transformers

Returns

featurenames list of strings Names of the features produced by transform

1526 Chapter 6 API (Application Programming Interface) Reference

scikitlearn user guide Release 0213

`getparams selfdeepTrue`
Get parameters for this estimator

Parameters

`deep` boolean optional If True will return the parameters for this estimator and contained subobjects that are estimators

Returns

`params` mapping of string to any Parameter names mapped to their values

`namedtransformers`

Access the fitted transformer by name

Readonly attribute to access any transformer by given name Keys are transformer names and values are the fitted transformer objects

`setparams selfkwargs`
Set the parameters of this estimator

Valid parameter keys can be listed with `getparams`

Returns

`self`

`transform selfX`
Transform X separately by each transformer concatenate results

Parameters

`X` arraylike or DataFrame of shape `nsamples nfeatures` The data to be transformed

`by` subset

Returns

`Xt` arraylike or sparse matrix shape `nsamples sumncomponents` hstack of results of transformers `sumncomponents` is the sum of `ncomponents` output dimension over transformers If any result is a sparse matrix everything will be converted to sparse matrices

Examples using `sklearncomposeColumnTransformer`

- Column Transformer with Mixed Types
- Column Transformer with Heterogeneous Data Sources

652sklearncompose TransformedTargetRegressor

`class sklearncompose TransformedTargetRegressor regressorNone transformerNone`

`funcNone inversefuncNone`

`checkinverseTrue`

Metaestimator to regress on a transformed target

Useful for applying a nonlinear transformation in regression problems This transformation can be given as a Transformer such as the `QuantileTransformer` or as a function and its inverse such as `log` and `exp`

The computation during fit is

`regressorfitX funcy`

65sklearncompose Composite Estimators 1527

scikitlearn user guide Release 0213

or
regressorfitX transformertransformy

The computation during predict is

inversefuncregressorpredictX

or

transformerinversetransformregressorpredictX

Read more in the User Guide

Parameters

regressor object defaultLinearRegression Regressor object such as derived from
RegressorMixin This regressor will automatically be cloned each time prior to fitting

transformer object defaultNone Estimator object such as derived from
TransformerMixin Cannot be set at the same time as func andinversefunc If

transformer isNone as well asfunc andinversefunc the transformer will be
an identity transformer Note that the transformer will be cloned during fitting Also the
transformer is restricting yto be a numpy array

func function optional Function to apply to ybefore passing to fit Cannot be set at the
same time as transformer The function needs to return a 2dimensional array If func
isNone the function used will be the identity function
inversefunc function optional Function to apply to the prediction of the regressor Can
not be set at the same time as transformer as well The function needs to return a
2dimensional array The inverse function is used to return predictions to the same space of
the original training labels

checkinverse bool defaultTrue Whether to check that transform followed by
inversetransform orfunc followed by inversefunc leads to the original tar
gets

Attributes

regressor object Fitted regressor

transformer object Transformer used in fit andpredict

Notes

Internally the target yis always converted into a 2dimensional array to be used by scikitlearn transformers

At the time of prediction the output will be reshaped to a have the same number of dimensions as y

Seexamplescomposeplottransformedtargetpy

Examples

```
import numpy as np
from sklearnlinearmodel import LinearRegression
from sklearncompose import TransformedTargetRegressor

array2

Methods

fitself X y sampleweight Fit the model according to the given training data

getparams self deep Get parameters for this estimator

predict self X Predict using the base regressor applying inverse

score self X y sampleweight Returns the coefficient of determination R2 of the pre
diction

setparams self params Set the parameters of this estimator

init self regressorNone transformerNone funcNone inversefuncNone

checkinverseTrue

fitselfXysampleweightNone

Fit the model according to the given training data

Parameters

Xarraylike sparse matrix shape nsamples nfeatures Training vector where
nsamples is the number of samples and nfeatures is the number of features

yarraylike shape nsamples Target values

sampleweight arraylike shape nsamples optional Array of weights that are assigned
to individual samples If not provided then each sample is given unit weight

Returns

self object

getparams selfdeepTrue

Get parameters for this estimator

Parameters

deep boolean optional If True will return the parameters for this estimator and contained
subobjects that are estimators

Returns

params mapping of string to any Parameter names mapped to their values

predictselfX

Predict using the base regressor applying inverse

The regressor is used to predict and the inversefunc orinversetransform is applied before
returning the prediction

Parameters

Xarraylike sparse matrix shape nsamples nfeatures Samples

65sklearncompose Composite Estimators 1529

scikitlearn user guide Release 0213

Returns

yhat array shape nsamples Predicted values

scoreselfXysampleweightNone

Returns the coefficient of determination R2 of the prediction

The coefficient R2 is defined as $1 - \frac{u}{v}$ where u is the residual sum of squares $y_{true} - y_{pred}$

2sum and v is the total sum of squares $y_{true} - y_{truemean}$ 2sum The best possible score

is 10 and it can be negative because the model can be arbitrarily worse A constant model that always

predicts the expected value of y disregarding the input features would get a R2 score of 00

Parameters

Xarraylike shape nsamples nfeatures Test samples For some estimators this may

be a precomputed kernel matrix instead shape nsamples nsamplesfitted where

nsamplesfitted is the number of samples used in the fitting for the estimator

yarraylike shape nsamples or nsamples noutputs True values for X

sampleweight arraylike shape nsamples optional Sample weights

Returns

score float R2 of selfpredictX wrt y

Notes

The R2 score used when calling score on a regressor will use multioutputuniformaverage

from version 023 to keep consistent with metricsr2score This will influence the score

method of all the multioutput regressors except for multioutputMultiOutputRegressor

To specify the default value manually and avoid the warning please either call metricsr2score

directly or make a custom scorer with metricsmakescorer the builtin scorer r2 uses

multioutputuniformaverage

setparams selfparams

Set the parameters of this estimator

The method works on simple estimators as well as on nested objects such as pipelines The latter have

parameters of the form componentparameter so that it's possible to update each component

of a nested object

Returns

self

Examples using sklearncomposeTransformedTargetRegressor

•Effect of transforming the targets in regression model

composemakecolumntransformer Construct a ColumnTransformer from the given transform

ers

653sklearncompose makecolumntransformer

sklearncompose makecolumntransformer transformers kwargs

Construct a ColumnTransformer from the given transformers

1530 Chapter 6 API (Application Programming Interface) Reference

scikitlearn user guide Release 0213

This is a shorthand for the ColumnTransformer constructor it does not require and does not permit naming the transformers Instead they will be given names automatically based on their types It also does not allow weighting with transformerweights

Parameters

transformers tuples of transformers and column selections

remainder 'drop' 'passthrough' or estimator default 'drop' By default only the specified columns in transformers are transformed and combined in the output and the nonspecified columns are dropped default of drop By specifying

remainderpassthrough all remaining columns that were not specified in transformers will be automatically passed through This subset of columns is concatenated with the output of the transformers By setting remainder to be an estimator the remaining nonspecified columns will use the remainder estimator The estimator must support fit andtransform

sparsethreshold float default 03 If the transformed output consists of a mix of sparse and dense data it will be stacked as a sparse matrix if the density is lower than this value Use sparsethreshold0 to always return dense When the transformed output consists of all sparse or all dense data the stacked result will be sparse or dense respectively and this keyword will be ignored

njobs int or None optional defaultNone Number of jobs to run in parallel None means 1 unless in a joblibparallelbackend context1means using all processors See

scikitlearn user guide Release 0213

66sklearncovariance Covariance Estimators

The sklearncovariance module includes methods and algorithms to robustly estimate the covariance of features given a set of points. The precision matrix defined as the inverse of the covariance is also estimated. Covariance estimation is closely related to the theory of Gaussian Graphical Models. User guide See the Covariance estimation section for further details.

covarianceEmpiricalCovariance Maximum likelihood covariance estimator

covarianceEllipticEnvelope An object for detecting outliers in a Gaussian distributed dataset

covarianceGraphicalLasso alpha mode Sparse inverse covariance estimation with an l_1 penalized estimator

covarianceGraphicalLassoCV alphas Sparse inverse covariance w crossvalidated choice of the l_1 penalty

covarianceLedoitWolf storeprecision LedoitWolf Estimator

covarianceMinCovDet storeprecision Minimum Covariance Determinant MCD robust estimator of covariance

covarianceOAS storeprecision Oracle Approximating Shrinkage Estimator

covarianceShrunkCovariance Covariance estimator with shrinkage

661sklearncovariance EmpiricalCovariance

class sklearncovariance EmpiricalCovariance storeprecision True as sume centered False

Maximum likelihood covariance estimator

Read more in the User Guide

Parameters

storeprecision bool Specifies if the estimated precision is stored

assume centered bool If True data are not centered before computation. Useful when working with data whose mean is almost but not exactly zero. If False default data are centered before computation.

Attributes

location arraylike shape nfeatures Estimated location ie the estimated mean

covariance 2D ndarray shape nfeatures nfeatures Estimated covariance matrix

precision 2D ndarray shape nfeatures nfeatures Estimated pseudoinverse matrix stored only if storeprecision is True

Examples

```
import numpy as np
```

```
from sklearncovariance import EmpiricalCovariance
```

```
from sklearn.datasets import make_gaussian_quantiles
```

```
realcov = np.array(8, 3,
```

```
3, 4,
```

```
rng = np.random.RandomState(0)
```

```
X = rng.multivariate_normal(mean=0, 0,
```

Returns

self object

getparams selfdeepTrue

Get parameters for this estimator

Parameters

deep boolean optional If True will return the parameters for this estimator and contained subobjects that are estimators

Returns

params mapping of string to any Parameter names mapped to their values

getprecision self

Getter for the precision matrix

Returns

precision arraylike The precision matrix associated to the current covariance object

mahalanobis selfX

Computes the squared Mahalanobis distances of given observations

Parameters

Xarraylike shape nsamples nfeatures The observations the Mahalanobis distances of the which we compute Observations are assumed to be drawn from the same distribution than the data used in fit

Returns

dist array shape nsamples Squared Mahalanobis distances of the observations

scoreselfXtest yNone

Computes the loglikelihood of a Gaussian data set with selfcovariance as an estimator of its covariance matrix

Parameters

Xtest arraylike shape nsamples nfeatures Test data of which we compute the likelihood where nsamples is the number of samples and nfeatures is the number of features Xtest is assumed to be drawn from the same distribution than the data used in fit including centering

ynot used present for API (Application Programming Interface) consistence purpose

Returns

resfloat The likelihood of the data set with selfcovariance as an estimator of its covariance matrix

setparams selfparams

Set the parameters of this estimator

The method works on simple estimators as well as on nested objects such as pipelines The latter have parameters of the form componentparameter so that it's possible to update each component of a nested object

1534 Chapter 6 API (Application Programming Interface) Reference

scikitlearn user guide Release 0213

Returns
self

Examples using sklearn.covariance.EmpiricalCovariance

- Robust covariance estimation and Mahalanobis distances relevance
- Robust vs Empirical covariance estimate

662sklearn.covariance.EllipticEnvelope

class sklearn.covariance.EllipticEnvelope store_precision=True assume_centered=False
support_fraction=None contamination=0.1
random_state=None

An object for detecting outliers in a Gaussian distributed dataset

Read more in the User Guide

Parameters

store_precision boolean optional default=True Specify if the estimated precision is stored

assume_centered boolean optional default=False If True the support of robust location and covariance estimates is computed and a covariance estimate is recomputed from it without centering the data Useful to work with data whose mean is significantly equal to zero but is not exactly zero If False the robust location and covariance are directly computed with the FastMCD algorithm without additional treatment

support_fraction float in [0, 1] optional default=None The proportion of points to be included in the support of the raw MCD estimate If None the minimum value of support_fraction will be used within the algorithm n_samples n_features 1

2

contamination float in [0, 0.5] optional default=0.1 The amount of contamination of the data set ie the proportion of outliers in the data set

random_state int RandomState instance or None optional default=None The seed of the pseudo random number generator to use when shuffling the data If int random_state is the seed used by the random number generator If RandomState instance random_state is the random number generator If None the random number generator is the RandomState instance used by np.random

Attributes

location arraylike shape n_features Estimated robust location

covariance arraylike shape n_features n_features Estimated robust covariance matrix

precision arraylike shape n_features n_features Estimated pseudo inverse matrix stored only if store_precision is True

support arraylike shape n_samples A mask of the observations that have been used to compute the robust estimates of location and shape

offset float Offset used to define the decision function from the raw scores We have the relation decision_function scoresamples_offset The offset depends on the contamination parameter and is defined in such a way we obtain the expected number of outliers samples with decision function 0 in training

See also

66sklearn.covariance.CovarianceEstimators 1535

scikitlearn user guide Release 0213

EmpiricalCovariance MinCovDet

Notes

Outlier detection from covariance estimation may break or not perform well in highdimensional settings In particular one will always take care to work with nsamples nfeatures 2

Examples

```
import numpy as np
from sklearn.covariance import EllipticEnvelope
truecov = np.array([
    [3, 4],
    [4, 3]
])
X = np.random.RandomState(0).multivariate_normal(mean=[0, 0],
    cov=truecov,
    size=500)
cov = EllipticEnvelope().fit(X)
predict returns 1 for an inlier and 0 for an outlier
cov.predict([
    [0, 0],
    [1, 1]
])
array([1, 1])
cov.covariance_
array([[0.7411, 0.2535],
       [0.2535, 0.3053]])
cov.location_
array([0.0813, 0.0427])
```

Methods

correctcovariance(self, data) Apply a correction to raw Minimum Covariance Determinant estimates

decisionfunction(self, X) Compute the decision function of the given observations

errornorm(self, compcov, norm, scaling) Computes the Mean Squared Error between two covariance estimators

fit(self, X, y) Fit the EllipticEnvelope model

fitpredict(self, X, y) Performs fit on X and returns labels for X

getparams(self, deep) Get parameters for this estimator

getprecision(self) Getter for the precision matrix

mahalanobis(self, X) Computes the squared Mahalanobis distances of given observations

predict(self, X) Predict the labels 1 inlier 0 outlier of X according to the fitted model

reweightcovariance(self, data) Reweight raw Minimum Covariance Determinant estimates

Continued on next page

scikitlearn user guide Release 0213

Table 634 – continued from previous page

score self X y sampleweight Returns the mean accuracy on the given test data and labels

scoresamples self X Compute the negative Mahalanobis distances

setparams self params Set the parameters of this estimator

init selfstoreprecisionTrue assumecenteredFalse supportfractionNone contamination01 randomstateNone

correctcovariance selfdata

Apply a correction to raw Minimum Covariance Determinant estimates

Correction using the empirical correction factor suggested by Rousseeuw and Van Driessen in RVD

Parameters

data arraylike shape nsamples nfeatures The data matrix with p features and n sam

ples The data set must be the one which was used to compute the raw estimates

Returns

covariancecorrected arraylike shape nfeatures nfeatures Corrected robust covariance estimate

References

RVD

decisionfunction selfXrawvaluesNone

Compute the decision function of the given observations

Parameters

Xarraylike shape nsamples nfeatures

rawvalues bool optional Whether or not to consider raw Mahalanobis distances as the

decision function Must be False default for compatibility with the others outlier detection tools

Deprecated since version 020 rawvalues has been deprecated in 020 and will be removed in 022

Returns

decision arraylike shape nsamples Decision function of the samples It is equal to

the shifted Mahalanobis distances The threshold for being an outlier is 0 which ensures a compatibility with other outlier detection algorithms

errornorm selfcompcov norm'frobenius' scalingTrue squaredTrue

Computes the Mean Squared Error between two covariance estimators In the sense of the Frobenius norm

Parameters

compcov arraylike shape nfeatures nfeatures The covariance to compare with

norm str The type of norm used to compute the error Available error types 'frobenius'

default sqrttrAtA 'spectral' sqrtmaxeigenvaluesAtA where A is the error

compcov selfcovariance

scaling bool If True default the squared error norm is divided by nfeatures If False the squared error norm is not rescaled

66sklearn covariance Covariance Estimators 1537

scikitlearn user guide Release 0213

squared bool Whether to compute the squared error norm or the error norm If True default the squared error norm is returned If False the error norm is returned

Returns

The Mean Squared Error in the sense of the Frobenius norm between self and compcov covariance estimators

fitselfXyNone

Fit the EllipticEnvelope model

Parameters

Xnumpy array or sparse matrix shape nsamples nfeatures Training data

yignored not used present for API (Application Programming Interface) consistency by convention

fitpredict selfXyNone

Performs fit on X and returns labels for X

Returns 1 for outliers and 1 for inliers

Parameters

Xndarray shape nsamples nfeatures Input data

yignored not used present for API (Application Programming Interface) consistency by convention

Returns

yndarray shape nsamples 1 for inliers 1 for outliers

getparams selfdeepTrue

Get parameters for this estimator

Parameters

deep boolean optional If True will return the parameters for this estimator and contained subobjects that are estimators

Returns

params mapping of string to any Parameter names mapped to their values

getprecision self

Getter for the precision matrix

Returns

precision arraylike The precision matrix associated to the current covariance object

mahalanobis selfX

Computes the squared Mahalanobis distances of given observations

Parameters

Xarraylike shape nsamples nfeatures The observations the Mahalanobis distances of the which we compute Observations are assumed to be drawn from the same distribution than the data used in fit

Returns

dist array shape nsamples Squared Mahalanobis distances of the observations

predictselfX

Predict the labels 1 inlier 1 outlier of X according to the fitted model

1538 Chapter 6 API (Application Programming Interface) Reference

scikitlearn user guide Release 0213

Parameters

Xarraylike shape nsamples nfeatures

Returns

isinlier array shape nsamples Returns 1 for anomaliesoutliers and 1 for inliers

reweightcovariance selfdata

Reweight raw Minimum Covariance Determinant estimates

Reweight observations using Rousseeuw’s method equivalent to deleting outlying observations from the data set before computing location and covariance estimates described in RVDriessen

Parameters

data arraylike shape nsamples nfeatures The data matrix with p features and n sam

ples The data set must be the one which was used to compute the raw estimates

Returns

locationreweighted arraylike shape nfeatures Reweighted robust location esti
mate

coviancereweighted arraylike shape nfeatures nfeatures Reweighted robust co
variance estimate

supportreweighted arraylike type boolean shape nsamples A mask of the obser
vations that have been used to compute the reweighted robust location and covariance
estimates

References

RVDriessen

scoreselfXysampleweightNone

Returns the mean accuracy on the given test data and labels

In multilabel classification this is the subset accuracy which is a harsh metric since you require for each
sample that each label set be correctly predicted

Parameters

Xarraylike shape nsamples nfeatures Test samples

yarraylike shape nsamples or nsamples noutputs True labels for X

sampleweight arraylike shape nsamples optional Sample weights

Returns

score float Mean accuracy of selfpredictX wrt y

scoresamples selfX

Compute the negative Mahalanobis distances

Parameters

Xarraylike shape nsamples nfeatures

Returns

negativemahaldistances arraylike shape nsamples Opposite of the Mahalanobis
distances

66sklearn covariance Covariance Estimators 1539

scikitlearn user guide Release 0213

setparams selfparams

Set the parameters of this estimator

The method works on simple estimators as well as on nested objects such as pipelines The latter have parameters of the form componentparameter so that it's possible to update each component of a nested object

Returns

self

Examples using sklearncovarianceEllipticEnvelope

•Comparing anomaly detection algorithms for outlier detection on toy datasets

•Outlier detection on a real data set

663sklearncovariance GraphicalLasso

classsklearncovariance GraphicalLasso alpha001 mode'cd' tol00001

enettol00001 maxiter100 verboseFalse

assumecenteredFalse

Sparse inverse covariance estimation with an l1penalized estimator

Read more in the User Guide

Parameters

alpha positive float default 001 The regularization parameter the higher alpha the more regularization the sparser the inverse covariance

mode 'cd' 'lars' default 'cd' The Lasso solver to use coordinate descent or LARS Use

LARS for very sparse underlying graphs where p n Elsewhere prefer cd which is more numerically stable

tolpositive float default 1e4 The tolerance to declare convergence if the dual gap goes below this value iterations are stopped

enettol positive float optional The tolerance for the elastic net solver used to calculate the descent direction This parameter controls the accuracy of the search direction for a given column update not of the overall parameter estimate Only used for mode'cd'

maxiter integer default 100 The maximum number of iterations

verbose boolean default False If verbose is True the objective function and dual gap are plotted at each iteration

assumecentered boolean default False If True data are not centered before computation Useful when working with data whose mean is almost but not exactly zero If False data are centered before computation

Attributes

location arraylike shape nfeatures Estimated location ie the estimated mean

covariance arraylike shape nfeatures nfeatures Estimated covariance matrix

precision arraylike shape nfeatures nfeatures Estimated pseudo inverse matrix

niter int Number of iterations run

class sklearn covariance GraphicalLassoCV alphas4 nrefinements4 cv'warn'

tol00001 enettol00001 maxiter100

mode'cd' njobsNone verboseFalse as

sumecenteredFalse

Sparse inverse covariance w crossvalidated choice of the l1 penalty

See glossary entry for crossvalidation estimator

Read more in the User Guide

Parameters

alphas integer or list positive float optional If an integer is given it fixes the number of points

on the grids of alpha to be used If a list is given it gives the grid to be used See the notes

in the class docstring for more details

nrefinements strictly positive integer The number of times the grid is refined Not used if

explicit values of alphas are passed

cvint crossvalidation generator or an iterable optional Determines the crossvalidation split

ting strategy Possible inputs for cv are

- None to use the default 3fold crossvalidation
- integer to specify the number of folds
- CV (Cross-Validation) splitter
- An iterable yielding train test splits as arrays of indices

For integerNone inputs KFold is used

Refer User Guide for the various crossvalidation strategies that can be used here

Changed in version 020 cvdefault value if None will change from 3fold to 5fold in

v022

tolpositive float optional The tolerance to declare convergence if the dual gap goes below

this value iterations are stopped

enettol positive float optional The tolerance for the elastic net solver used to calculate the

descent direction This parameter controls the accuracy of the search direction for a given

column update not of the overall parameter estimate Only used for mode'cd'

maxiter integer optional Maximum number of iterations

66sklearn covariance Covariance Estimators 1543

scikitlearn user guide Release 0213

mode 'cd' 'lars' The Lasso solver to use coordinate descent or LARS Use LARS for
very sparse underlying graphs where number of features is greater than number of samples
Elsewhere prefer cd which is more numerically stable
njobs int or None optional defaultNone number of jobs to run in parallel None means 1
unless in a joblibparallelbackend context1means using all processors See
Glossary for more details

verbose boolean optional If verbose is True the objective function and duality gap are printed
at each iteration
assumecentered boolean If True data are not centered before computation Useful when
working with data whose mean is almost but not exactly zero If False data are centered
before computation

Attributes
location arraylike shape nfeatures Estimated location ie the estimated mean
covariance numpyndarray shape nfeatures nfeatures Estimated covariance matrix
precision numpyndarray shape nfeatures nfeatures Estimated precision matrix inverse
covariance
alpha float Penalization parameter selected
cvalphas list of float All penalization parameters explored
gridscores 2D numpyndarray nalphas nfolds Loglikelihood score on leftout data
across folds
niter int Number of iterations run for the optimal alpha

See also
graphicallasso GraphicalLasso
Notes
The search for the optimal penalization parameter alpha is done on an iteratively refined grid first the cross
validated scores on a grid are computed then a new refined grid is centered around the maximum and so on
One of the challenges which is faced here is that the solvers can fail to converge to a wellconditioned estimate
The corresponding values of alpha then come out as missing values but the optimum may be close to these
missing values

•Sparse inverse covariance estimation

665sklearn covariance LedoitWolf

class sklearn covariance LedoitWolf storeprecision True assumecentered False

blocksize 1000

LedoitWolf Estimator

LedoitWolf is a particular form of shrinkage where the shrinkage coefficient is computed using O Ledoit and M Wolf’s formula as described in “A WellConditioned Estimator for LargeDimensional Covariance Matrices”

Ledoit and Wolf Journal of Multivariate Analysis V olume 88 Issue 2 February 2004 pages 365411

Read more in the User Guide

Parameters

storeprecision bool default True Specify if the estimated precision is stored

assumecentered bool default False If True data will not be centered before computation

Useful when working with data whose mean is almost but not exactly zero If False de

fault data will be centered before computation

blocksize int default 1000 Size of the blocks into which the covariance matrix will be split

during its LedoitWolf estimation This is purely a memory optimization and does not affect

results

Attributes

location arraylike shape nfeatures Estimated location ie the estimated mean

covariance arraylike shape nfeatures nfeatures Estimated covariance matrix

precision arraylike shape nfeatures nfeatures Estimated pseudo inverse matrix stored

only if storeprecision is True

shrinkage float 0 shrinkage 1 Coefficient in the convex combination used for the

computation of the shrunk estimate

Notes

The regularised covariance is

$$\frac{1}{n} \text{shrinkage} \text{cov} + \frac{1 - \text{shrinkage}}{n} \text{np.identity}(n_{\text{features}})$$

where $\mu = \text{trace}(\text{cov}) / n_{\text{features}}$ and shrinkage is given by the Ledoit and Wolf formula see References

Minimum Covariance Determinant MCD robust estimator of covariance

The Minimum Covariance Determinant covariance estimator is to be applied on Gaussian distributed data but could still be relevant on data drawn from a unimodal symmetric distribution. It is not meant to be used with multimodal data: the algorithm used to fit a MinCovDet object is likely to fail in such a case. One should consider projection pursuit methods to deal with multimodal datasets.

Read more in the User Guide

Parameters

store_precision bool Specify if the estimated precision is stored
assume_centered bool If True the support of the robust location and the covariance estimates is computed and a covariance estimate is recomputed from it without centering the data. Useful to work with data whose mean is significantly equal to zero but is not exactly zero. If False the robust location and covariance are directly computed with the FastMCD algorithm without additional treatment.
support_fraction float 0 support_fraction 1 The proportion of points to be included in the support of the raw MCD estimate. Default is None which implies that the minimum value of support_fraction will be used within the algorithm. n_samples n_features 1 2
random_state int RandomState instance or None optional default=None If int random_state is the seed used by the random number generator. If RandomState instance random_state is the random number generator. If None the random number generator is the RandomState instance used by np.random.

Attributes

raw_location arraylike shape n_features The raw robust estimated location before correction and reweighting.
raw_covariance arraylike shape n_features n_features The raw robust estimated covariance before correction and reweighting.
raw_support arraylike shape n_samples A mask of the observations that have been used to compute the raw robust estimates of location and shape before correction and reweighting.
location arraylike shape n_features Estimated robust location
covariance arraylike shape n_features n_features Estimated robust covariance matrix

scikitlearn user guide Release 0213

precision arraylike shape nfeatures Estimated pseudo inverse matrix stored only if storeprecision is True

support arraylike shape nsamples A mask of the observations that have been used to compute the robust estimates of location and shape

dist arraylike shape nsamples Mahalanobis distances of the training set on which fit is called observations

667sklearncovariance OAS

classsklearncovariance OASstoreprecisionTrue assumecenteredFalse

Oracle Approximating Shrinkage Estimator

Read more in the User Guide

OAS is a particular form of shrinkage described in “Shrinkage Algorithms for MMSE Covariance Estimation” Chen et al IEEE Trans on Sign Proc V olume 58 Issue 10 October 2010

The formula used here does not correspond to the one given in the article In the original article formula 23 states that $2p$ is multiplied by Tracecovcov in both the numerator and denominator but this operation is omitted because for a large p the value of $2p$ is so small that it doesn't affect the value of the estimator

Parameters

storeprecision bool defaultTrue Specify if the estimated precision is stored

assumecentered bool defaultFalse If True data will not be centered before computation

Useful when working with data whose mean is almost but not exactly zero If False default data will be centered before computation

Attributes

covariance arraylike shape nfeatures nfeatures Estimated covariance matrix

precision arraylike shape nfeatures nfeatures Estimated pseudo inverse matrix stored only if storeprecision is True

shrinkage float 0 shrinkage 1 coefficient in the convex combination used for the computation of the shrunk estimate

1554 Chapter 6 API (Application Programming Interface) Reference

scikitlearn user guide Release 0213

Notes

The regularised covariance is

$\frac{1}{n} \text{shrinkage} \text{cov} \text{shrinkage} \mu \text{npidentitynfeatures}$

where $\mu = \text{tracecov} / \text{nfeatures}$ and shrinkage is given by the OAS formula see References

Parameters

empcov 2D ndarray shape nfeatures nfeatures Empirical covariance from which to compute the covariance estimate
alpha positive float The regularization parameter the higher alpha the more regularization the sparser the inverse covariance
covinit 2D array nfeatures nfeatures optional The initial guess for the covariance
mode 'cd' 'lars' The Lasso solver to use coordinate descent or LARS Use LARS for very sparse underlying graphs where $p \gg n$ Elsewhere prefer cd which is more numerically stable
tolpositive float optional The tolerance to declare convergence if the dual gap goes below this value iterations are stopped
enettol positive float optional The tolerance for the elastic net solver used to calculate the descent direction This parameter controls the accuracy of the search direction for a given column update not of the overall parameter estimate Only used for mode 'cd'
maxiter integer optional The maximum number of iterations
verbose boolean optional If verbose is True the objective function and dual gap are printed at each iteration
returncosts boolean optional If returncosts is True the objective function and dual gap at each iteration are returned
eps float optional The machineprecision regularization in the computation of the Cholesky diagonal factors Increase this for very illconditioned systems
returnniter bool optional Whether or not to return the number of iterations

Returns

covariance 2D ndarray shape nfeatures nfeatures The estimated covariance matrix
precision 2D ndarray shape nfeatures nfeatures The estimated sparse precision matrix
costs list of objective dualgap pairs The list of values of the objective function and the dual gap at each iteration Returned only if returncosts is True
niter int Number of iterations Returned only if returnniter is set to True

$2sum$ and v is the total sum of squares $y_{true} - y_{truemean}$ $2sum$ The best possible score

is 1.0 and it can be negative because the model can be arbitrarily worse A constant model that always

predicts the expected value of y disregarding the input features would get a R2 score of 0.0

Parameters

Xarraylike shape nsamples nfeatures Test samples For some estimators this may

be a precomputed kernel matrix instead shape nsamples nsamplesfitted where

nsamplesfitted is the number of samples used in the fitting for the estimator

yarraylike shape nsamples or nsamples noutputs True values for X

sampleweight arraylike shape nsamples optional Sample weights

Returns

score float R2 of selfpredictX wrt y

Notes

The R2 score used when calling score on a regressor will use multioutputuniformaverage

from version 0.23 to keep consistent with metricsr2score This will influence the score

method of all the multioutput regressors except for multioutputMultiOutputRegressor

To specify the default value manually and avoid the warning please either call metricsr2score

directly or make a custom scorer with metricsmakescorer the builtin scorer r2 uses

multioutputuniformaverage

setparams selfparams

Set the parameters of this estimator

The method works on simple estimators as well as on nested objects such as pipelines The latter have

parameters of the form componentparameter so that it's possible to update each component

of a nested object

Returns

self

1566 Chapter 6 API (Application Programming Interface) Reference

scikitlearn user guide Release 0213

transform selfXYNone copyTrue

Apply the dimension reduction learned on the train data

Parameters

Xarraylike shape nsamples nfeatures Training vectors where nsamples is the number of samples and nfeatures is the number of predictors

Yarraylike shape nsamples ntargets Target vectors where nsamples is the number of samples and ntargets is the number of response variables

copy boolean default True Whether to copy X and Y or perform inplace normalization

Returns

xscores if Y is not given xscores yscores otherwise

672sklearncrossdecomposition PLSCanonical

classsklearncrossdecomposition PLSCanonical ncomponents2 scaleTrue algorithm'nipals' maxiter500 tol1e06

copyTrue
PLSCanonical implements the 2 blocks canonical PLS of the original Wold algorithm Tenenhaus 1998 p204 referred as PLSC2A in Wegelin 2000

This class inherits from PLS with mode"A" and deflationmode"canonical" normyweightsTrue and algorithm"nipals" but svd should provide similar results up to numerical errors

Read more in the User Guide

Parameters

ncomponents int default 2 Number of components to keep

scale boolean default True Option to scale data

algorithm string "nipals" or "svd" The algorithm used to estimate the weights It will be called ncomponents times ie once for each iteration of the outer loop

maxiter an integer default 500 the maximum number of iterations of the NIPALS inner loop used only if algorithm"nipals"

tolnonnegative real default 1e06 the tolerance used in the iterative algorithm

copy boolean default True Whether the deflation should be done on a copy Let the default value to True unless you don't care about side effect

Attributes

xweights array shape p ncomponents X block weights vectors

yweights array shape q ncomponents Y block weights vectors

xloadings array shape p ncomponents X block loadings vectors

yloadings array shape q ncomponents Y block loadings vectors

xscores array shape nsamples ncomponents X scores

67sklearncrossdecomposition Cross decomposition 1567

scikitlearn user guide Release 0213

yscores array shape nsamples ncomponents Y scores

xrotations array shape p ncomponents X block to latents rotations

yrotations array shape q ncomponents Y block to latents rotations

niter arraylike Number of iterations of the NIPALS inner loop for each component Not useful if the algorithm provided is “svd”

See also

CCA

PLSSVD

Notes

Matrices

T xscores

U yscores

W xweights

C yweights

P xloadings

Q yloadings

Are computed such that

$X^T P T^T \text{Err}$ and $Y^T U Q T^T \text{Err}$

$T_k^T X_k W_k$ for k in $\text{rang}(\text{ncomponents})$

$U_k^T Y_k C_k$ for k in $\text{rang}(\text{ncomponents})$

xrotations $W P T W^T$

yrotations $C Q T C^T$

where X_k and Y_k are residual matrices at iteration k

Slides explaining PLS

For each component k find weights u, v that optimize

$\max \text{corr}(X_k u, Y_k v) / \sqrt{\text{std}(X_k u)^2 + \text{std}(Y_k v)^2}$ such that $u^T v = 1$

Note that it maximizes both the correlations between the scores and the intrablock variances

The residual matrix of X X_{k+1} block is obtained by the deflation on the current X score x_{score}

The residual matrix of Y Y_{k+1} block is obtained by deflation on the current Y score This performs a canonical symmetric version of the PLS regression But slightly different than the CCA This is mostly used for modeling

This implementation provides the same results that the “plsrm” package provided in the R language R

project using the function `plsca(X, Y)` Results are equal or collinear with the function `pls mode`

canonical of the “mixOmics” package The difference relies in the fact that mixOmics implementation does not exactly implement the Wold algorithm since it does not normalize y_{weights} to one

`datahome` `str` `None` The path to scikitlearn data dir

`sklearn.datasets.dumpsVMLightfile`
`sklearn.datasets.dumpsVMLightfile` `Xy` `f` `zerobased` `True` `comment` `None`
`queryid` `None` `multilabel` `False`
Dump the dataset in svmlight libsvm file format

This format is a textbased format with one sample per line It does not store zero valued features hence is
suitable for sparse dataset

The first element of each line can be used to store a target variable to predict

Parameters

`X` `arraylike` `sparse matrix` `shape` `nsamples` `nfeatures` Training vectors where
`nsamples` is the number of samples and `nfeatures` is the number of features

`y` `arraylike` `sparse matrix` `shape` `nsamples` `nlabels` Target values Class labels
must be an integer or float or arraylike objects of integer or float for multilabel classifica
tions

`fstring` or `filelike` in binary mode If string specifies the path that will contain the data If
`filelike` data will be written to `f` `f` should be opened in binary mode

`zerobased` `boolean` optional Whether column indices should be written `zerobased` `True` or
`onebased` `False`

`comment` `string` optional Comment to insert at the top of the file This should be either a
Unicode string which will be encoded as UTF8 or an ASCII byte string If a comment

1578 Chapter 6 API (Application Programming Interface) Reference

scikitlearn user guide Release 0.21.3

is given then it will be preceded by one that identifies the file as having been dumped by scikitlearn. Note that not all tools grok comments in SVMlight files.

queryid arraylike shape n_samples Array containing pairwise preference constraints

qid in svmformat

multilabel boolean optional Samples may have several labels each see <https://www.cs.cmu.edu/~dwj/libsvmtools/datasets/multilabel.html>

New in version 0.17 parameter multilabel to support multilabel datasets

Examples using sklearn.datasets.dump_svmlight_file

- Libsvm GUI

sklearn.datasets.fetch_20newsgroups

sklearn.datasets.fetch_20newsgroups(data_home=None, subset='train', categories=None, shuffle=True, random_state=42, remove_duplicate_headers=True, load_if_missing=True)

Load the filenames and data from the 20 newsgroups dataset classification

Download it if necessary

Classes 20

Samples total 18846

Dimensionality 1

Features text

Read more in the User Guide

Parameters

data_home optional default None Specify a download and cache folder for the datasets. If None all scikitlearn data is stored in 'scikitlearn_data' subfolders

subset 'train' or 'test' 'all' optional Select the dataset to load 'train' for the training set 'test' for the test set 'all' for both with shuffled ordering

categories None or collection of string or unicode If None default load all the categories. If not None list of category names to load other categories ignored

shuffle bool optional Whether or not to shuffle the data might be important for models that make the assumption that the samples are independent and identically distributed iid such as stochastic gradient descent

random_state int RandomState instance or None default Determines random number generation for dataset shuffling. Pass an int for reproducible output across multiple function calls. See Glossary

remove_duplicate_headers tuple May contain any subset of 'headers' 'footers' 'quotes'. Each of these are kinds of text that will be detected and removed from the newsgroup posts preventing classifiers from overfitting on metadata

'headers' removes newsgroup headers 'footers' removes blocks at the ends of posts that look like signatures and 'quotes' removes lines that appear to be quoting another post

'headers' follows an exact standard the other filters are not always correct

68 sklearn.datasets Datasets 1579

scikitlearn user guide Release 0213
downloadifmissing optional True by default If False raise an IOError if the data is not locally available instead of trying to download the data from the source site
Returns

bunch Bunch object with the following attribute

- bunchdata list length nsamples
- bunchtarget array shape nsamples
- bunchfilenames list length nsamples
- bunchDESCR a description of the dataset
- bunchtargetnames a list of categories of the returned data length nclasses This depends on the categories parameter

Examples using sklearn.datasets.fetch20newsgroups

- Topic extraction with Nonnegative Matrix Factorization and Latent Dirichlet Allocation
- Biclustering documents with the Spectral Coclustering algorithm
- Column Transformer with Heterogeneous Data Sources
- Sample pipeline for text feature extraction and evaluation
- FeatureHasher and DictVectorizer Comparison
- Clustering text documents using kmeans

Parameters
1580 Chapter 6 API (Application Programming Interface) Reference

scikitlearn user guide Release 0213

subset 'train' or 'test' 'all' optional Select the dataset to load 'train' for the training set 'test' for the test set 'all' for both with shuffled ordering
remove tuple May contain any subset of 'headers' 'footers' 'quotes' Each of these are kinds of text that will be detected and removed from the newsgroup posts preventing classifiers from overfitting on metadata
'headers' removes newsgroup headers 'footers' removes blocks at the ends of posts that look like signatures and 'quotes' removes lines that appear to be quoting another post
datahome optional default None Specify a download and cache folder for the datasets If None all scikitlearn data is stored in 'scikitlearndata' subfolders
downloadifmissing optional True by default If False raise an IOError if the data is not locally available instead of trying to download the data from the source site
returnXy boolean default False If True returns datadata datatarget in stead of a Bunch object

New in version 020

Returns

bunch Bunch object with the following attribute

- bunchdata sparse matrix shape nsamples nfeatures
- bunchtarget array shape nsamples
- bunchtargetnames a list of categories of the returned data length nclasses
- bunchDESCR a description of the dataset

data target tuple ifreturnXy is True New in version 020

Examples using sklearndatasetsfetch20newsgroupsvectorized

- The JohnsonLindenstrauss bound for embedding with random projections
- Model Complexity Influence
- Multiclass sparse logisitic regression on newgroups20

sklearndatasets fetchcaliforniahousing

sklearndatasets fetchcaliforniahousing datahomeNone downloadifmissingTrue

scikitlearn user guide Release 0213

returnXy boolean defaultFalse If True returns data target instead of a Bunch object See below for more information about the data andtarget object

New in version 020

Returns

data Bunch

Dictionarylike object the interesting attributes are

- ‘data’ the data to learn
- ‘target’ the regression target for each sample
- ‘DESCR’ a description of the dataset

data target tuple ifreturnXy is True New in version 020

sklearn.datasets.fetchlfwpairs

sklearn.datasets.fetchlfwpairs subset‘train’ datahomeNone funneledTrue re

size05 colorFalse sliceslice70 195None slice78

172None downloadifmissingTrue

Load the Labeled Faces in the Wild LFW pairs dataset classification

Download it if necessary

Classes 5749

Samples total 13233

Dimensionality 5828

Features real between 0 and 255

In the official README.txt this task is described as the “Restricted” task As I am not sure as to implement the “Unrestricted” variant correctly I left it as unsupported for now

The original images are 250 x 250 pixels but the default slice and resize arguments reduce them to 62 x 47

Read more in the User Guide

Parameters

subset optional default ‘train’ Select the dataset to load ‘train’ for the development training

set ‘test’ for the development test set and ‘10folds’ for the official evaluation set that is

meant to be used with a 10folds cross validation

datahome optional default None Specify another download and cache folder for the

datasets By default all scikitlearn data is stored in ‘scikitlearn_data’ subfolders

funneled boolean optional default True Download and use the funneled variant of the

dataset

resize float optional default 0.5 Ratio used to resize the each face picture

color boolean optional default False Keep the 3 RGB channels instead of averaging them to a single gray level channel If color is True the shape of the data has one more dimension than the shape with color False

slice optional Provide a custom 2D slice height width to extract the ‘interesting’ part of

the jpeg files and avoid use statistical correlation from the background

1584 Chapter 6 API (Application Programming Interface) Reference

scikitlearn user guide Release 0213

downloadifmissing optional True by default If False raise a IOError if the data is not locally available instead of trying to download the data from the source site

Returns

The data is returned as a Bunch object with the following attributes

data numpy array of shape 2200 5828 Shape depends on subset Each row corresponds to 2 ravel'd face images of original size 62 x 47 pixels Changing the slice resize or subset parameters will change the shape of the output

pairs numpy array of shape 2200 2 62 47 Shape depends on subset Each row has 2 face images corresponding to same or different person from the dataset containing 5749 people Changing the slice resize or subset parameters will change the shape of the output

target numpy array of shape 2200 Shape depends on subset Labels associated to each pair of images The two label values being different persons or the same person

DESCR string Description of the Labeled Faces in the Wild LFW dataset

Parameters

datahome optional default None Specify another download and cache folder for the

datasets By default all scikitlearn data is stored in ‘scikitlearndata’ subfolders

shuffle boolean optional If True the order of the dataset is shuffled to avoid having images of

the same person grouped

randomstate int RandomState instance or None default0 Determines random number

generation for dataset shuffling Pass an int for reproducible output across multiple function

calls See Glossary

downloadifmissing optional True by default If False raise a IOError if the data is not

locally available instead of trying to download the data from the source site

1586 Chapter 6 API (Application Programming Interface) Reference

scikitlearn user guide Release 0213

Returns

An object with the following attributes

data numpy array of shape 400 4096 Each row corresponds to a ravelled face image of original size 64 x 64 pixels

images numpy array of shape 400 64 64 Each row is a face image corresponding to one of the 40 subjects of the dataset

target numpy array of shape 400 Labels associated to each face image Those labels are ranging from 039 and correspond to the Subject IDs

DESCR string Description of the modified Olivetti Faces Dataset

Examples using sklearn.datasets.fetcholivettifaces

- Face completion with a multioutput estimators
- Online learning of a dictionary of parts of faces
- Faces dataset decompositions
- Pixel importances with a parallel forest of trees

sklearn.datasets.fetchopenml

sklearn.datasets.fetchopenml nameNone version'active' dataidNone datahomeNone

targetcolumn'default'target' cacheTrue returnXyFalse

Fetch dataset from openml by name or dataset id

Datasets are uniquely identified by either an integer ID or by a combination of name and version ie there might be multiple versions of the 'iris' dataset Please give either name or dataid not both In case a name is given a version can also be provided

Read more in the User Guide

Note EXPERIMENTAL

The API (Application Programming Interface) is experimental particularly the return value structure and might have small backwardincompatible changes in future releases

Parameters

name str or None String identifier of the dataset Note that OpenML can have multiple datasets with the same name

version integer or 'active' default'active' Version of the dataset Can only be provided if alsoname is given If 'active' the oldest version that's still active is used Since there may be more than one active version of a dataset and those versions may fundamentally be different from one another setting an exact version is highly recommended

dataid int or None OpenML ID of the dataset The most specific way of retrieving a dataset

If dataid is not given name and potential version are used to obtain a dataset

datahome string or None default None Specify another download and cache folder for the data sets By default all scikitlearn data is stored in 'scikitlearn\data' subfolders

68sklearn.datasets Datasets 1587

scikitlearn user guide Release 0213

targetcolumn string list or None default 'defaulttarget' Specify the column name in the data to use as target If 'defaulttarget' the standard target column a stored on the server is used IfNone all columns are returned as data and the target is None If list of strings all columns with these names are returned as multitarget Note not all scikitlearn classifiers can handle all types of multioutput combinations
cache boolean defaultTrue Whether to cache downloaded datasets using joblib
returnXy boolean defaultFalse If True returns data target instead of a Bunch object See below for more information about the data andtarget objects

Returns
data Bunch Dictionarylike object with attributes
data nparray or scipysparsematrix of floats The feature matrix Categorical features are encoded as ordinals
target nparray The regression target or classification labels if applicable Dtype is float if numeric and object if categorical
DESCR str The full description of the dataset
featurenames list The names of the dataset columns
categories dict Maps each categorical feature name to a list of values such that the value encoded as i is ith in the list
details dict More metadata from OpenML
data target tuple ifreturnXy is True

Note EXPERIMENTAL
This interface is experimental and subsequent releases may change attributes without notice although there should only be minor changes to data andtarget
Missing values in the 'data' are represented as NaN's Missing values in 'target' are represented as NaN's numerical target or None categorical target

Examples using sklearndatasetsfetchopenml
•Gaussian process regression GPR on Mauna Loa CO2 data
•MNIST classification using multinomial logistic L1
•Early stopping of Stochastic Gradient Descent
•Classifier Chain
•Visualization of MLP weights on MNIST

scikitlearn user guide Release 0213

Read more in the User Guide

Parameters

datahome optional default None Specify another download and cache folder for the datasets By default all scikitlearn data is stored in 'scikitlearndata' subfolders

downloadifmissing optional True by default If False raise a IOError if the data is not locally available instead of trying to download the data from the source site

Returns

The data is returned as a Bunch object with the following attributes

coverages array shape 14 1592 1212 These represent the 14 features measured at each point of the map grid The latitudelongitude values for the grid are discussed below Missing data is represented by the value 9999

train record array shape 1624 The training points for the data Each point has three fields

- train'species' is the species name
- train'dd long' is the longitude in degrees
- train'dd lat' is the latitude in degrees

test record array shape 620 The test points for the data Same format as the training data

Nx Ny integers The number of longitudes x and latitudes y in the grid

xleftlowercorner yleftlowercorner floats The xy position of the lowerleft corner in degrees

gridsize float The spacing between points of the grid in degrees

Notes

This dataset represents the geographic distribution of species The dataset is provided by Phillips et al 2006

The two species are

- "Bradypus variegatus" the Brownthroated Sloth
- "Microryzomys minutus" also known as the Forest Small Rice Rat a rodent that lives in Peru Colombia Ecuador Peru and Venezuela

- For an example of using this dataset with scikitlearn see examples

applicationsplotspeciesdistributionmodelingpy

scikitlearn user guide Release 0213

sklearn.datasets.get_data_home

sklearn.datasets.get_data_home(data_home=None)

Return the path of the scikitlearn data dir

This folder is used by some large dataset loaders to avoid downloading the data several times

By default the data dir is set to a folder named 'scikitlearn_data' in the user home folder

Alternatively it can be set by the 'SCIKIT_LEARN_DATA' environment variable or programmatically by giving an explicit folder path. The '~' symbol is expanded to the user home folder

If the folder does not already exist it is automatically created

Parameters

data_home: str, None. The path to scikitlearn data dir

Examples using sklearn.datasets.get_data_home

- Out-of-core classification of text documents

sklearn.datasets.load_boston

sklearn.datasets.load_boston(return_Xy=False)

Load and return the boston house prices dataset (regression)

Samples total: 506

Dimensionality: 13

Features: real, positive

Targets: real, 5 - 50

Read more in the User Guide

Parameters

return_Xy: boolean, default=False. If True, returns data, target instead of a Bunch object. See below for more information about the data and target object

New in version 0.18

Returns

data: Bunch. Dictionary-like object. The interesting attributes are 'data' the data to learn, 'target' the regression targets, 'DESCR' the full description of the dataset and 'filename' the physical location of boston.csv dataset. Added in version 0.20

data, target: tuple. If return_Xy is True. New in version 0.18

Notes

Changed in version 0.20: Fixed a wrong data point at 445.0

68 sklearn.datasets. Datasets: 1591

scikitlearn user guide Release 0213

Examples

from sklearn.datasets import load_boston

boston = load_boston

print(boston.data.shape)

506 13

Examples using sklearn.datasets.load_boston

- Outlier detection on a real data set
- Model Complexity Influence
- Effect of transforming the targets in regression model
- Plot individual and voting regression predictions
- Gradient Boosting regression
- Feature selection using SelectFromModel and LassoCV
- Imputing missing values before building an estimator
- Plotting CrossValidated Predictions

sklearn.datasets.load_breast_cancer

sklearn.datasets.load_breast_cancer(return_X_y=False)

Load and return the breast cancer wisconsin dataset classification

The breast cancer dataset is a classic and very easy binary classification dataset

Classes 2

Samples per class 212 357

Samples total 569

Dimensionality 30

Features real positive

Read more in the User Guide

Parameters

return_X_y boolean default False If True returns data target instead of a Bunch

object See below for more information about the data and target object

New in version 0.18

Returns

data Bunch Dictionary-like object the interesting attributes are 'data' the data to learn
'target' the classification labels 'target_names' the meaning of the labels 'feature_names'
the meaning of the features and 'DESCR' the full description of the dataset 'filename' the
physical location of breast cancer csv dataset added in version 0.20

data target tuple if return_X_y is True New in version 0.18

The copy of UCI ML Breast Cancer Wisconsin Diagnostic dataset is

downloaded from

1592 Chapter 6 API (Application Programming Interface) Reference

scikitlearn user guide Release 0213

<https://googleusercontent.com/U2Uwz2>

Examples

Let's say you are interested in the samples 10 50 and 85 and want to know their class name

```
from sklearn.datasets import loadbreastcancer
```

```
data = loadbreastcancer
```

```
data.target[10:50:85]
```

```
array([1, 0, ...])
```

```
list(data.target_names)
```

```
['malignant', 'benign']
```

```
sklearn.datasets.load_diabetes
```

```
sklearn.datasets.load_diabetes(return_Xy=False)
```

Load and return the diabetes dataset regression

Samples total 442

Dimensionality 10

Features real 2 x 2

Targets integer 25 346

Read more in the User Guide

Parameters

return_Xy boolean default False If True returns data target instead of a Bunch

object See below for more information about the data and target object

New in version 0.18

Returns

data Bunch Dictionary-like object the interesting attributes are 'data' the data to learn 'target' the regression target for each sample 'datafilename' the physical location of diabetes data csv dataset and 'targetfilename' the physical location of diabetes targets csv dataset added in version 0.20

data target tuple if return_Xy is True New in version 0.18

Examples using sklearn.datasets.load_diabetes

- Cross-validation on diabetes Dataset Exercise
 - Imputing missing values before building an estimator
 - Lasso path using LARS
 - Linear Regression Example
 - Sparsity Example Fitting only features 1 and 2
 - Lasso and Elastic Net
 - Lasso model selection CrossValidation AIC BIC
- 68sklearn.datasets Datasets 1593

scikitlearn user guide Release 0213

sklearn.datasets.load_digits

sklearn.datasets.load_digits nclass=10 return_Xy=False

Load and return the digits dataset classification

Each datapoint is a 8x8 image of a digit

Classes 10

Samples per class 180

Samples total 1797

Dimensionality 64

Features integers 016

Read more in the User Guide

Parameters

nclass integer between 0 and 10 optional default=10 The number of classes to return

return_Xy boolean default=False If True returns data target instead of a Bunch

object See below for more information about the data and target object

New in version 0.18

Returns

data Bunch Dictionary-like object the interesting attributes are 'data' the data to learn

'images' the images corresponding to each sample 'target' the classification labels for

each sample 'target_names' the meaning of the labels and 'DESCR' the full description

of the dataset

data target tuple if return_Xy is True New in version 0.18

This is a copy of the test set of the UCI ML handwritten digits datasets

<https://archive.ics.uci.edu/ml/datasets/Optical+Recognition+of+Handwritten+Digits>

Examples

To load the data and visualize the images

```
from sklearn.datasets import load_digits
digits = load_digits
print(digits.data.shape)
1797 64
import matplotlib.pyplot as plt
plt.gray()
plt.matshow(digits.images[0])
plt.show
```

Examples using sklearn.datasets.load_digits

- The Johnson-Lindenstrauss bound for embedding with random projections
- Explicit feature map approximation for RBF (Radial Basis Function) kernels
- Recognizing handwritten digits

1594 Chapter 6 API (Application Programming Interface) Reference

scikitlearn user guide Release 0213

- Feature agglomeration
- Various Agglomerative Clustering on a 2D embedding of digits
- A demo of KMeans clustering on the handwritten digits data
- Pipelining chaining a PCA (Principal Component Analysis) and a logistic regression
- Selecting dimensionality reduction with Pipeline and GridSearchCV
- The Digit Dataset
- Early stopping of Gradient Boosting
- Digits Classification Exercise
- Crossvalidation on Digits Dataset Exercise
- Recursive feature elimination
- Comparing various online solvers
- L1 Penalty and Sparsity in Logistic Regression
- Manifold learning on handwritten digits Locally Linear Embedding Isomap
- Plotting Validation Curves
- Parameter estimation using grid search with crossvalidation
- Comparing randomized search and grid search for hyperparameter estimation
- Balance model complexity and crossvalidated score
- Plotting Learning Curves
- Kernel Density Estimation
- Dimensionality Reduction with Neighborhood Components Analysis
- Restricted Boltzmann Machine features for digit classification
- Compare Stochastic learning strategies for MLPClassifier
- Label Propagation digits Demonstrating performance
- Label Propagation digits active learning

sklearn.datasets loadfiles

sklearn.datasets loadfiles containerpath descriptionNone categoriesNone

loadcontentTrue shuffleTrue encodingNone de

codeerror'strict' randomstate0

Load text files with categories as subfolder names

Individual samples are assumed to be files stored a two levels folder structure such as the following

containerfolder

category1folder file1.txt file2.txt file42.txt

category2folder file43.txt file44.txt

The folder names are used as supervised signal label names The individual file names are not important

This function does not try to extract features into a numpy array or scipy sparse matrix In addition if

loadcontent is false it does not try to load the files in memory

68sklearn.datasets Datasets 1595

scikitlearn user guide Release 0213

To use text files in a scikitlearn classification or clustering algorithm you will need to use the sklearn featureextractiontext module to build a feature extraction transformer that suits your problem
If you set loadcontentTrue you should also specify the encoding of the text using the ‘encoding’ parameter
For many modern text files ‘utf8’ will be the correct encoding If you leave encoding equal to None then the content will be made of bytes instead of Unicode and you will not be able to use most functions in sklearn featureextractiontext
Similar feature extractors should be built for other kind of unstructured data input such as images audio video

Read more in the User Guide

Parameters
containerpath string or unicode Path to the main folder holding one subfolder per category
description string or unicode optional defaultNone A paragraph describing the characteristic of the dataset its source reference etc
categories A collection of strings or None optional defaultNone If None default load all the categories If not None list of category names to load other categories ignored
loadcontent boolean optional defaultTrue Whether to load or not the content of the different files If true a ‘data’ attribute containing the text information is present in the data structure returned If not a filenames attribute gives the path to the files
shuffle bool optional defaultTrue Whether or not to shuffle the data might be important for models that make the assumption that the samples are independent and identically distributed iid such as stochastic gradient descent
encoding string or None default is None If None do not try to decode the content of the files eg for images or other nontext content If not None encoding to use to decode text files to Unicode if loadcontent is True
decodeerror ‘strict’ ‘ignore’ ‘replace’ optional Instruction on what to do if a byte sequence is given to analyze that contains characters not of the given encoding Passed as keyword argument ‘errors’ to bytesdecode
randomstate int RandomState instance or None default0 Determines random number generation for dataset shuffling Pass an int for reproducible output across multiple function calls See Glossary
Returns
data Bunch Dictionarylike object the interesting attributes are either data the raw text data to learn or ‘filenames’ the files holding it ‘target’ the classification labels integer index ‘targetnames’ the meaning of the labels and ‘DESCR’ the full description of the dataset
sklearn.datasets.loadiris
sklearn.datasets.loadiris returnXyFalse
Load and return the iris dataset classification
The iris dataset is a classic and very easy multiclass classification dataset
1596 Chapter 6 API (Application Programming Interface) Reference

Parameters

returnXy boolean defaultFalse If True returns data target instead of a Bunch

object See below for more information about the data andtarget object

New in version 018

Returns

data Bunch Dictionarylike object the interesting attributes are 'data' the data to learn
'target' the classification labels 'targetnames' the meaning of the labels 'featurenames'
the meaning of the features 'DESCR' the full description of the dataset 'filename' the
physical location of iris csv dataset added in version 020
data target tuple ifreturnXy is True New in version 018

Notes

Changed in version 020 Fixed two wrong data points according to Fisher's paper The new version is the same
as in R but not as in the UCI Machine Learning Repository

Examples

Let's say you are interested in the samples 10 25 and 50 and want to know their class name

from sklearn.datasets import loadiris

data loadiris

datatarget10 25 50

array0 0 1

listdatatargetnames

setosa versicolor virginica

Examples using sklearn.datasets.loadiris

- Plot classification probability
 - Kmeans Clustering
 - Concatenating multiple feature extraction methods
 - The Iris Dataset
 - PCA (Principal Component Analysis) example with Iris Dataset
 - Incremental PCA (Principal Component Analysis)
 - Comparison of LDA and PCA (Principal Component Analysis) 2D projection of Iris dataset
 - Plot the decision boundaries of a VotingClassifier
- 68sklearn.datasets Datasets 1597

scikitlearn user guide Release 0213

- Early stopping of Gradient Boosting
 - Plot the decision surfaces of ensembles of trees on the iris dataset
 - SVM (Support Vector Machine) Exercise
 - Test with permutations the significance of a classification score
 - Univariate Feature Selection
 - Gaussian process classification GPC on iris dataset
 - Regularization path of L1 Logistic Regression
 - Logistic Regression 3class Classifier
 - Plot multiclass SGD on the iris dataset
 - GMM covariances
 - Receiver Operating Characteristic ROC with cross validation
 - Nested versus nonnested crossvalidation
 - Confusion matrix
 - Receiver Operating Characteristic ROC
 - PrecisionRecall
 - Nearest Neighbors Classification
 - Nearest Centroid Classification
 - Comparing Nearest Neighbors with and without Neighborhood Components Analysis
 - Compare Stochastic learning strategies for MLPClassifier
 - Decision boundary of label propagation versus SVM (Support Vector Machine) on the Iris dataset
 - SVM (Support Vector Machine) with custom kernel
 - SVMAnova SVM (Support Vector Machine) with univariate feature selection
 - Plot different SVM (Support Vector Machine) classifiers in the iris dataset
 - RBF (Radial Basis Function) SVM (Support Vector Machine) parameters
 - Plot the decision surface of a decision tree on the iris dataset
 - Understanding the decision tree structure
- sklearn.datasets loadlinnerud
sklearn.datasets loadlinnerud returnXyFalse
Load and return the linnerud dataset multivariate regression
Samples total 20
Dimensionality 3 for both data and target
Features integer
Targets integer

scikitlearn user guide Release 0213

returnXy boolean defaultFalse If True returns data target instead of a Bunch
object See below for more information about the data andtarget object
New in version 018

Returns
data Bunch Dictionarylike object the interesting attributes are 'data' and 'target' the two
multivariate datasets with 'data' corresponding to the exercise and 'target' corresponding
to the physiological measurements as well as 'featurenames' and 'targetnames' In addi
tion you will also have access to 'datafilename' the physical location of linnerud data csv
dataset and 'targetfilename' the physical location of linnerud targets csv dataset added
in version020

data target tuple ifreturnXy is True New in version 018

sklearndatasets loadsampleimage

sklearndatasets loadsampleimage imagename

Load the numpy array of a single sample image

Read more in the User Guide

Parameters

imagename chinajpg flowerjpg The name of the sample image loaded

Returns

img 3D array The image as a numpy array height x width x color

Examples

from sklearndatasets import loadsampleimage

china loadsampleimagechinajpg

chinadtype

dtypeuint8

chinashape

427 640 3

flower loadsampleimageflowerjpg

flowerdtype

dtypeuint8

flowershape

427 640 3

Examples using sklearndatasetsloadsampleimage

•Color Quantization using KMeans

sklearndatasets loadsampleimages

sklearndatasets loadsampleimages

Load sample images for image manipulation

Loads both china andflower

68sklearndatasets Datasets 1599

scikitlearn user guide Release 0213

Read more in the User Guide

Returns

data Bunch Dictionarylike object with the following attributes ‘images’ the two sample images ‘filenames’ the file names for the images and ‘DESCR’ the full description of the dataset

Examples

To load the data and visualize the images

from sklearn.datasets import load_sample_images

dataset = load_sample_images

load_dataset_images

2

first_img_data = dataset.images[0]

first_img_data.shape

(427, 640, 3)

first_img_data.dtype

dtype: uint8

sklearn.datasets.load_svmlight_file

sklearn.datasets.load_svmlight_file fn: features=None dtype: class ‘numpy.float64’

multi_label=False zero_based=‘auto’ query_id=False

offset=0 length=1

Load datasets in the svmlight / libsvm format into sparse CSR (Compressed Sparse Row) matrix

This format is a text-based format with one sample per line. It does not store zero-valued features hence is

suitable for sparse dataset

The first element of each line can be used to store a target variable to predict

This format is used as the default format for both svmlight and the libsvm command line programs

Parsing a text-based source can be expensive. When working on repeatedly on the same dataset it is recom-

mended to wrap this loader with joblib.MemoryCache to store a memmapped backup of the CSR (Compressed Sparse Row) results of the

first call and benefit from the near instantaneous loading of memmapped structures for the subsequent calls

In case the file contains a pairwise preference constraint known as “qid” in the svmlight format these are

ignored unless the query_id parameter is set to True. These pairwise preference constraints can be used to

constraint the combination of samples when using pairwise loss functions as is the case in some learning to

rank problems so that only pairs with the same query_id value are considered

This implementation is written in Cython and is reasonably fast. However a faster API-compatible loader is

also available at

https://github.com/blondel/svmlight_loader

Parameters

fn: file-like int Path to a file to load. If a path ends in “gz” or “bz2” it will be uncom-

pressed on the fly. If an integer is passed it is assumed to be a file descriptor. A file-like

or file descriptor will not be closed by this function. A file-like object must be opened in

binary mode

1600 Chapter 6 API (Application Programming Interface) Reference

scikitlearn user guide Release 0213

nfeatures int or None The number of features to use If None it will be inferred This argument is useful to load several files that are subsets of a bigger sliced dataset each subset might not have examples of every feature hence the inferred shape might vary from one slice to another nfeatures is only required if offset orlength are passed a non default value

dtype numpy data type default npfloat64 Data type of dataset to be loaded This will be the data type of the output numpy arrays Xandy

multilabel boolean optional default False Samples may have several labels each see <https://www.cs.cmu.edu/~dwj/libsvmtools/datasets/multilabel.html>

zerobased boolean or "auto" optional default "auto" Whether column indices in f are zero based True or onebased False If column indices are onebased they are transformed to zerobased to match PythonNumPy conventions If set to "auto" a heuristic check is applied to determine this from the file contents Both kinds of files occur "in the wild" but they are unfortunately not selfidentifying Using "auto" or True should always be safe when nooffset orlength is passed If offset orlength are passed the "auto" mode falls back tozerobasedTrue to avoid having the heuristic check yield inconsistent results on different segments of the file

queryid boolean default False If True will return the queryid array for each file

offset integer optional default 0 Ignore the offset first bytes by seeking forward then discarding the following bytes up until the next new line character

length integer optional default 1 If strictly positive stop reading any new line of data once the position in the file has reached the offset length bytes threshold

Returns
Xscipy sparse matrix of shape nsamples nfeatures
y ndarray of shape nsamples or in the multilabel a list of tuples of length nsamples
queryid array of shape nsamples queryid for each sample Only returned when queryid is set to True
See also

loadsvmlightfiles similar function for loading multiple files in this format enforcing the same number of featurescolumns on all of them

sklearn.datasets.loadsvmlightfiles

sklearn.datasets.loadsvmlightfiles files nfeaturesNone dtypeclass

'numpy.float64' multilabelFalse

zerobased'auto' queryidFalse offset0 length

1

Load dataset from multiple files in SVMlight format

This function is equivalent to mapping loadsvmlightfile over a list of files except that the results are concatenated into a single flat list and the samples vectors are constrained to all have the same number of features. In case the file contains a pairwise preference constraint known as "qid" in the svmlight format these are ignored unless the queryid parameter is set to True. These pairwise preference constraints can be used to constraint the combination of samples when using pairwise loss functions as is the case in some learning to rank problems so that only pairs with the same queryid value are considered.

Parameters

files iterable over str filelike int Paths of files to load. If a path ends in "gz" or "bz2" it will be uncompressed on the fly. If an integer is passed it is assumed to be a file descriptor. Filelikes and file descriptors will not be closed by this function. Filelike objects must be

opened in binary mode.

nfeatures int or None The number of features to use. If None it will be inferred from the maximum column index occurring in any of the files.

This can be set to a higher value than the actual number of features in any of the input files but setting it to a lower value will cause an exception to be raised.

dtype numpy data type default np.float64 Data type of dataset to be loaded. This will be the data type of the output numpy arrays.

Xandy multilabel boolean optional Samples may have several labels each see <https://www.cs.cmu.edu/~tgcj/libsvmtools/datasets/multilabel.html>

zerobased boolean or "auto" optional Whether column indices in f are zerobased. True or onebased. False. If column indices are onebased they are transformed to zerobased to match Python/NumPy conventions. If set to "auto" a heuristic check is applied to determine this from the file contents. Both kinds of files occur "in the wild" but they are unfortunately not self-identifying. Using "auto" or True should always be safe when no offset or length is passed. If offset or length are passed the "auto" mode falls back to zerobased=True to avoid having the heuristic check yield inconsistent results on different segments of the file.

queryid boolean defaults to False. If True will return the queryid array for each file.

offset integer optional default 0 Ignore the offset first bytes by seeking forward then discarding the following bytes up until the next new line character.

length integer optional default 1 If strictly positive stop reading any new line of data once the position in the file has reached the offset + length bytes threshold.

Returns

X1 y1 ... Xn yn

where each Xi yi pair is the result from loadsvmlightfile(files[i])

If queryid is set to True this will return instead X1 y1 q1

Xn yn qn where Xi yi qi is the result from

loadsvmlightfile(files[i])

shuffle=True random_state=None

Generate a random nclass classification problem

1608 Chapter 6 API (Application Programming Interface) Reference

scikitlearn user guide Release 0213

This initially creates clusters of points normally distributed std1 about vertices of an ninformative dimensional hypercube with sides of length 2classep and assigns an equal number of clusters to each class It introduces interdependence between these features and adds various types of further noise to the data Without shuffling Xhorizontally stacks features in the following order the primary ninformative features followed by nredundant linear combinations of the informative features followed by nrepeated duplicates drawn randomly with replacement from the informative and redundant features The remaining features are filled with random noise Thus without shuffling all useful features are contained in the columns

X ninformative nredundant nrepeated

Read more in the User Guide

Parameters

nsamples int optional default100 The number of samples

nfeatures int optional default20 The total number of features These comprise ninformative informative features nredundant redundant features nrepeated duplicated features and nfeaturesninformativenredundantnrepeated useless features drawn at random

ninformative int optional default2 The number of informative features Each class is composed of a number of gaussian clusters each located around the vertices of a hypercube in a subspace of dimension ninformative For each cluster informative features are drawn independently from N0 1 and then randomly linearly combined within each cluster in order to add covariance The clusters are then placed on the vertices of the hypercube nredundant int optional default2 The number of redundant features These features are generated as random linear combinations of the informative features nrepeated int optional default0 The number of duplicated features drawn randomly from the informative and the redundant features nclasses int optional default2 The number of classes or labels of the classification problem

nclustersperclass int optional default2 The number of clusters per class

weights list of floats or None defaultNone The proportions of samples assigned to each class If None then classes are balanced Note that if lenweights nclasses

1 then the last class weight is automatically inferred More than nsamples samples may be returned if the sum of weights exceeds 1

flipy float optional default001 The fraction of samples whose class are randomly exchanged Larger values introduce noise in the labels and make the classification task harder

classep float optional default10 The factor multiplying the hypercube size Larger values spread out the clustersclasses and make the classification task easier

hypercube boolean optional defaultTrue If True the clusters are put on the vertices of a hypercube If False the clusters are put on the vertices of a random polytope

shift float array of shape nfeatures or None optional default00 Shift features by the specified value If None then features are shifted by a random value drawn in classep classep

scale float array of shape nfeatures or None optional default10 Multiply features by the specified value If None then features are scaled by a random value drawn in 1 100

Note that scaling happens after shifting

shuffle boolean optional defaultTrue Shuffle the samples and the features

sklearn.datasets.make_hastie102

sklearn.datasets.make_hastie102 nsamples=12000 randomstate=None

Generates data for binary classification used in Hastie et al 2009 Example 102

The ten features are standard independent Gaussian and the target y is defined by

$y_i = 1$ if $\sum_{j=1}^{10} x_{ij} \geq 0.5$ else $y_i = 0$

Read more in the User Guide

Parameters

nsamples int optional default=12000 The number of samples

randomstate int RandomState instance or None default=None Determines random number generation for dataset creation Pass an int for reproducible output across multiple function calls See Glossary

Returns

X array of shape (nsamples, 10) The input samples

y array of shape (nsamples,) The output values

See also

make_gaussian_quantiles a generalization of this dataset approach

References

1

Examples using sklearn.datasets.make_hastie102

- Gradient Boosting regularization
- Discrete versus Real AdaBoost
- Early stopping of Gradient Boosting
- Demonstration of multivariate evaluation on cross_val_score and GridSearchCV

sklearn.datasets.make_low_rank_matrix

sklearn.datasets.make_low_rank_matrix nsamples=100 nfeatures=100 effective_rank=10

tail_strength=0.5 randomstate=None

Generate a mostly low rank matrix with bell-shaped singular values

Most of the variance can be explained by a bell-shaped curve of width effective_rank the low rank part of the singular values profile is

$\frac{1}{i} \cdot \text{tail_strength} \cdot \exp(-i / \text{effective_rank})$

The remaining singular values' tail is fat decreasing as

$\frac{1}{i} \cdot \text{tail_strength} \cdot \exp(-i / \text{effective_rank})$

1614 Chapter 6 API (Application Programming Interface) Reference

scikitlearn user guide Release 0213

The low rank part of the profile can be considered the structured signal part of the data while the tail can be considered the noisy part of the data that cannot be summarized by a low number of linear components singular vectors

This kind of singular profiles is often seen in practice for instance

- gray level pictures of faces
- TFIDF vectors of text documents crawled from the web

Read more in the User Guide

Parameters

nsamples int optional default100 The number of samples
nfeatures int optional default100 The number of features
effectiverank int optional default10 The approximate number of singular vectors required to explain most of the data by linear combinations
tailstrength float between 00 and 10 optional default05 The relative importance of the fat noisy tail of the singular values profile
randomstate int RandomState instance or None default Determines random number generation for dataset creation Pass an int for reproducible output across multiple function calls See Glossary

Returns

Xarray of shape nsamples nfeatures The matrix
sklearn.datasets.makemoons
sklearn.datasets.makemoons nsamples100 shuffleTrue noiseNone randomstateNone

Make two interleaving half circles

A simple toy dataset to visualize clustering and classification algorithms Read more in the User Guide

Parameters

nsamples int optional default100 The total number of points generated
shuffle bool optional defaultTrue Whether to shuffle the samples
noise double or None defaultNone Standard deviation of Gaussian noise added to the data
randomstate int RandomState instance or None default Determines random number generation for dataset shuffling and noise Pass an int for reproducible output across multiple function calls See Glossary

Returns

Xarray of shape nsamples 2 The generated samples
yarray of shape nsamples The integer labels 0 or 1 for class membership of each sample

Examples using sklearn.datasets.makemoons

- Comparing anomaly detection algorithms for outlier detection on toy datasets
- Classifier comparison
- Comparing different hierarchical linkage methods on toy datasets

68sklearn.datasets Datasets 1615

scikitlearn user guide Release 0213

- Comparing different clustering algorithms on toy datasets
- Varying regularization in Multilayer Perceptron
- Compare Stochastic learning strategies for MLPClassifier
- Feature discretization

sklearn.datasets.makemultilabelclassification

sklearn.datasets.makemultilabelclassification nsamples100 nfeatures20

nclasses5 nlabels2 length50

allowunlabeledTrue sparseFalse

returnindicator'dense' re

turnndistributionsFalse ran

domstateNone

Generate a random multilabel classification problem

For each sample the generative process is

- pick the number of labels $n \sim \text{Poisson}(n_{\text{labels}})$
- n times choose a class $c \sim \text{Multinomial}(\theta_c)$
- pick the document length $k \sim \text{Poisson}(length)$
- k times choose a word $w \sim \text{Multinomial}(\theta_{cw})$

In the above process rejection sampling is used to make sure that n is never zero or more than $nclasses$ and that the document length is never zero Likewise we reject classes which have already been chosen

Read more in the User Guide

Parameters

nsamples int optional default100 The number of samples

nfeatures int optional default20 The total number of features

nclasses int optional default5 The number of classes of the classification problem

nlabels int optional default2 The average number of labels per instance More precisely the number of labels per sample is drawn from a Poisson distribution with $nlabels$ as its expected value but samples are bounded using rejection sampling by $nclasses$ and must be nonzero if `allowunlabeled` is False

length int optional default50 The sum of the features number of words if documents is drawn from a Poisson distribution with this expected value

allowunlabeled bool optional defaultTrue If True some instances might not belong to any class

sparse bool optional defaultFalse If True return a sparse feature matrix

New in version 0.17 parameter to allow sparse output

returnindicator 'dense' default 'sparse' False If dense return Y in the dense binary

indicator format If sparse return Y in the sparse binary indicator format False

returns a list of lists of labels

turnndistributions bool optional defaultFalse If True return the prior class probability and conditional probabilities of features given classes from which the data was drawn

1616 Chapter 6 API (Application Programming Interface) Reference

scikitlearn user guide Release 0213

randomstate int RandomState instance or None default Determines random number generation for dataset creation Pass an int for reproducible output across multiple function calls See Glossary

Returns

Xarray of shape nsamples nfeatures The generated samples

Yarray or sparse CSR (Compressed Sparse Row) matrix of shape nsamples nclasses The label sets

pc array shape nclasses The probability of each class being drawn Only returned if

returndistributionsTrue

pwc array shape nfeatures nclasses The probability of each feature being drawn given

each class Only returned if returndistributionsTrue

Examples using sklearn.datasets.makemultilabelclassification

- Multilabel classification

- Plot randomly generated multilabel dataset

sklearn.datasets.makeregression

sklearn.datasets.makeregression nsamples100 nfeatures100 ninformative10

ntargets1 bias00 effectiverankNone

tailstrength05 noise00 shuffleTrue coeffFalse

randomstateNone

Generate a random regression problem

The input set can either be well conditioned by default or have a low rankfat tail singular profile See

makelowrankmatrix for more details

The output is generated by applying a potentially biased random linear regression model with

ninformative nonzero regressors to the previously generated input and some gaussian centered noise with some adjustable scale

Read more in the User Guide

Parameters

nsamples int optional default100 The number of samples

nfeatures int optional default100 The number of features

ninformative int optional default10 The number of informative features ie the number of features used to build the linear model used to generate the output

ntargets int optional default1 The number of regression targets ie the dimension of the y output vector associated with a sample By default the output is a scalar

bias float optional default00 The bias term in the underlying linear model

effectiverank int or None optional defaultNone

if not None The approximate number of singular vectors required to explain most of the input data by linear combinations Using this kind of singular spectrum in the input allows

the generator to reproduce the correlations often observed in practice

if None The input set is well conditioned centered and gaussian with unit variance

68sklearn.datasets Datasets 1617

scikitlearn user guide Release 0213

tailstrength float between 00 and 10 optional default05 The relative importance of the fat noisy tail of the singular values profile if effectiverank is not None
noise float optional default00 The standard deviation of the gaussian noise applied to the output
shuffle boolean optional defaultTrue Shuffle the samples and the features
coef boolean optional defaultFalse If True the coefficients of the underlying linear model are returned
randomstate int RandomState instance or None default Determines random number generation for dataset creation Pass an int for reproducible output across multiple function calls See Glossary

Returns

Xarray of shape nsamples nfeatures The input samples
yarray of shape nsamples or nsamples ntargets The output values
coef array of shape nfeatures or nfeatures ntargets optional The coefficient of the underlying linear model It is returned only if coef is True
Examples using sklearn.datasets.makeregression

- Prediction Latency
- Effect of transforming the targets in regression model
- Plot Ridge coefficients as a function of the L2 regularization
- Robust linear model estimation using RANSAC
- Lasso on dense and sparse data
- HuberRegressor vs Ridge on dataset with strong outliers

sklearn.datasets.makescurve
sklearn.datasets.makescurve nsamples100 noise00 randomstateNone
Generate an S curve dataset

Read more in the User Guide

Parameters

nsamples int optional default100 The number of sample points on the S curve
noise float optional default00 The standard deviation of the gaussian noise
randomstate int RandomState instance or None default Determines random number generation for dataset creation Pass an int for reproducible output across multiple function calls See Glossary

Returns

Xarray of shape nsamples 3 The points
tarray of shape nsamples The univariate position of the sample according to the main dimension of the points in the manifold

scikitlearn user guide Release 0213

Examples using sklearn.datasets.make_s_curve

- tSNE The effect of various perplexity values on the shape
- Comparison of Manifold Learning methods

sklearn.datasets.make_sparse_coded_signal

sklearn.datasets.make_sparse_coded_signal n_samples n_components n_features

n_nonzero_coefs random_state=None

Generate a signal as a sparse combination of dictionary elements

Returns a matrix Y of shape (n_samples, n_features) such as D is (n_features, n_components) X is (n_components, n_samples) and each column of X has exactly n_nonzero_coefs nonzero elements

Read more in the User Guide

Parameters

n_samples int number of samples to generate

n_components int number of components in the dictionary

n_features int number of features of the dataset to generate

n_nonzero_coefs int number of active nonzero coefficients in each sample

random_state int RandomState instance or None default Determines random number generation for dataset creation Pass an int for reproducible output across multiple function calls See Glossary

Returns

data array of shape (n_samples, n_features) The encoded signal Y

dictionary array of shape (n_features, n_components) The dictionary with normalized components D

code array of shape (n_components, n_samples) The sparse code such that each column of this matrix has exactly n_nonzero_coefs nonzero items X

Examples using sklearn.datasets.make_sparse_coded_signal

- Orthogonal Matching Pursuit

sklearn.datasets.make_sparse_spd_matrix

sklearn.datasets.make_sparse_spd_matrix dim1 alpha=0.95 norm_diag=False

smallest_coef=0.1 largest_coef=0.9 random_state=None

Generate a sparse symmetric definite positive matrix

Read more in the User Guide

Parameters

dim integer optional default=1 The size of the random matrix to generate

alpha float between 0 and 1 optional default=0.95 The probability that a coefficient is zero see notes Larger values enforce more sparsity

68sklearn.datasets Datasets 1619

scikitlearn user guide Release 0213

normdiag boolean optional defaultFalse Whether to normalize the output matrix to make the leading diagonal elements all 1

smallestcoef float between 0 and 1 optional default01 The value of the smallest coefficient

largestcoef float between 0 and 1 optional default09 The value of the largest coefficient

randomstate int RandomState instance or None default Determines random number generation for dataset creation Pass an int for reproducible output across multiple function calls See Glossary

Returns

prec sparse matrix of shape dim dim The generated matrix

See also

makespdmatrix

Notes

The sparsity is actually imposed on the cholesky factor of the matrix Thus alpha does not translate directly into the filling fraction of the matrix itself

Examples using sklearn.datasets.makesparsepdmatrix

•Sparse inverse covariance estimation

sklearn.datasets.makesparseuncorrelated

sklearn.datasets.makesparseuncorrelated nsamples100 nfeatures10 randomstateNone

Generate a random regression problem with sparse uncorrelated design

This dataset is described in Celeux et al 1 as

$X = N \times 1$

$y = X_0 + 2X_1 + 2X_2 + 15X_3$

Only the first 4 features are informative The remaining features are useless

Read more in the User Guide

Parameters

nsamples int optional default100 The number of samples

nfeatures int optional default10 The number of features

randomstate int RandomState instance or None default Determines random number generation for dataset creation Pass an int for reproducible output across multiple function calls See Glossary

Returns

X array of shape nsamples nfeatures The input samples

y array of shape nsamples The output values

1620 Chapter 6 API (Application Programming Interface) Reference

transform_algorithm='omp' transform_min_nonzero_coefs=None transform_alpha=None

n_jobs=None code_init=None dict_init=None verbose=False split_sign=False random_state=None positive_code=False positive_dict=False

fitself X y None

Fit the model from data in X

Parameters

X array-like shape (n_samples, n_features) Training vector where n_samples is the number of samples and n_features is the number of features

y ignored

Returns

self object Returns the object itself

1624 Chapter 6 API (Application Programming Interface) Reference

scikitlearn user guide Release 0213

fittransform selfXyNone fitparams

Fit to data then transform it

Fits transformer to X and y with optional parameters fitparams and returns a transformed version of X

Parameters

Xnumpy array of shape nsamples nfeatures Training set

ynumpy array of shape nsamples Target values

Returns

Xnew numpy array of shape nsamples nfeaturesnew Transformed array

getparams selfdeepTrue

Get parameters for this estimator

Parameters

deep boolean optional If True will return the parameters for this estimator and contained subobjects that are estimators

Returns

params mapping of string to any Parameter names mapped to their values

setparams selfparams

Set the parameters of this estimator

The method works on simple estimators as well as on nested objects such as pipelines The latter have parameters of the form componentparameter so that it's possible to update each component of a nested object

Returns

self

transform selfX

Encode the data as a sparse combination of the dictionary atoms

Coding method is determined by the object parameter transformalgorithm

Parameters

Xarray of shape nsamples nfeatures Test data to be transformed must have the same number of features as the data used to train the model

Returns

Xnew array shape nsamples ncomponents Transformed data

692sklearndecomposition FactorAnalysis

classsklearndecomposition FactorAnalysis ncomponentsNone tol001 copyTrue

maxiter1000 noisevarianceinitNone

svdmethod'randomized' iteratedpower3

randomstate0

Factor Analysis FA

A simple linear generative model with Gaussian latent variables

The observations are assumed to be caused by a linear transformation of lower dimensional latent factors and added Gaussian noise Without loss of generality the factors are distributed according to a Gaussian with zero mean and unit covariance The noise is also zero mean and has an arbitrary diagonal covariance matrix

69sklearndecomposition Matrix Decomposition 1625

scikitlearn user guide Release 0213

If we would restrict the model further by assuming that the Gaussian noise is even isotropic all diagonal entries are the same we would obtain PPCA

FactorAnalysis performs a maximum likelihood estimate of the so called loading matrix the transformation of the latent variables to the observed ones using expectationmaximization EM

Read more in the User Guide

Parameters

ncomponents int None Dimensionality of latent space the number of components of Xthat are obtained after transform If None ncomponents is set to the number of features

tolfloat Stopping tolerance for EM algorithm

copy bool Whether to make a copy of X If False the input X gets overwritten during fitting

maxiter int Maximum number of iterations

noisevarianceinit None array shapenfeatures The initial guess of the noise variance for each feature If None it defaults to np.onesnfeatures

svdmethod 'lapack' 'randomized' Which SVD method to use If 'lapack' use standard SVD from scipy.linalg if 'randomized' use fast randomizedsvd function Defaults to 'randomized' For most applications 'randomized' will be sufficiently precise while providing significant speed gains Accuracy can also be improved by setting higher values for iteratedpower If this is not sufficient for maximum precision you should choose 'lapack'

iteratedpower int optional Number of iterations for the power method 3 by default Only used ifsvdmethod equals 'randomized'

randomstate int RandomState instance or None optional default0 If int randomstate is the seed used by the random number generator If RandomState instance randomstate is the random number generator If None the random number generator is the RandomState instance used by np.random Only used when svdmethod equals 'randomized'

Attributes

components array ncomponents nfeatures Components with maximum variance

loglike list niterations The log likelihood at each iteration

noisevariance array shapenfeatures The estimated noise variance for each feature

niter int Number of iterations run

See also

PCA (Principal Component Analysis) Principal component analysis is also a latent linear variable model which however assumes equal noise variance for each feature This extra assumption makes probabilistic PCA (Principal Component Analysis) faster as it can be computed in closed form

FastICA Independent component analysis a latent variable model with nonGaussian latent variables

Examples using sklearn.decomposition.FactorAnalysis

- Model selection with Probabilistic PCA (Principal Component Analysis) and Factor Analysis FA

- Faces dataset decompositions

693sklearn.decomposition.FastICA

class sklearn.decomposition.FastICA ncomponents=None algorithm='parallel' whiten=True

fun='logcosh' funargs=None maxiter=200 tol=0.0001

winit=None randomstate=None

FastICA a fast algorithm for Independent Component Analysis

Read more in the User Guide

Parameters

ncomponents int optional Number of components to use If none is passed all are used

algorithm 'parallel' 'deflation' Apply parallel or deflational algorithm for FastICA

whiten boolean optional If whiten is false the data is already considered to be whitened and no whitening is performed

fun string or function optional Default 'logcosh' The functional form of the G function used in the approximation to negentropy Could be either 'logcosh' 'exp' or 'cube' You can also provide your own function It should return a tuple containing the value of the function

and of its derivative in the point Example

```
def mygx return x3 - 3 x2 meanaxis=1
```

funargs dictionary optional Arguments to send to the functional form If empty and if

fun='logcosh' funargs will take value 'alpha' 10

maxiter int optional Maximum number of iterations during fit

tol float optional Tolerance on update at each iteration

winit None of an ncomponents ncomponents ndarray The mixing matrix to be used to initialize the algorithm

randomstate int RandomState instance or None optional default=None If int ran

domstate is the seed used by the random number generator If RandomState instance

randomstate is the random number generator If None the random number generator is the RandomState instance used by np.random

Attributes

components 2D array shape ncomponents nfeatures The unmixing matrix

mixing array shape nfeatures ncomponents The mixing matrix

niter int If the algorithm is "deflation" niter is the maximum number of iterations run across all components Else they are just the number of iterations taken to converge

69sklearn.decomposition.MatrixDecomposition 1629

scikitlearn user guide Release 0213

Notes

Implementation based on A Hyvarinen and E Oja Independent Component Analysis Algorithms and Applications Neural Networks 1345 2000 pp 411430

Examples

```
from sklearn.datasets import load_digits

getparams selfdeepTrue

Get parameters for this estimator

Parameters

deep boolean optional If True will return the parameters for this estimator and contained

subobjects that are estimators

Returns

params mapping of string to any Parameter names mapped to their values

inversetransform selfXcopyTrue

Transform the sources back to the mixed data apply mixing matrix

Parameters

Xarraylike shape nsamples ncomponents Sources where nsamples is the number

of samples and ncomponents is the number of components

copy bool optional If False data passed to fit are overwritten Defaults to True

Returns

Xnew arraylike shape nsamples nfeatures

setparams selfparams

Set the parameters of this estimator

The method works on simple estimators as well as on nested objects such as pipelines The latter have

parameters of the form componentparameter so that it's possible to update each component

of a nested object

Returns

self

transform selfXcopyTrue

Recover the sources from X apply the unmixing matrix

Parameters

Xarraylike shape nsamples nfeatures Data to transform where nsamples is the

number of samples and nfeatures is the number of features

copy bool optional If False data passed to fit are overwritten Defaults to True

Returns

Xnew arraylike shape nsamples ncomponents

Examples using sklearndecompositionFastICA

•Blind source separation using FastICA

•FastICA on 2D point clouds

•Faces dataset decompositions

69sklearndecomposition Matrix Decomposition 1631

scikitlearn user guide Release 0213

694sklearn.decomposition.IncrementalPCA

class sklearn.decomposition.IncrementalPCA ncomponents=None whiten=False copy=True
batchsize=None

Incremental principal components analysis IPCA

Linear dimensionality reduction using Singular Value Decomposition of the data keeping only the most significant singular vectors to project the data to a lower dimensional space The input data is centered but not scaled for each feature before applying the SVD

Depending on the size of the input data this algorithm can be much more memory efficient than a PCA (Principal Component Analysis)

This algorithm has constant memory complexity on the order of batchsize enabling use of mmap files without loading the entire file into memory

The computational overhead of each SVD is $O(\text{batchsize} \times \text{nfeatures}^2)$ but only $2 \times \text{batchsize} \times \text{nfeatures}$ samples remain in memory at a time There will be $\text{nfeatures} \times \text{batchsize}$ SVD computations to get the principal components versus 1 large SVD of complexity $O(\text{nfeatures}^2)$ for PCA (Principal Component Analysis)

Read more in the User Guide

Parameters

ncomponents int or None default=None Number of components to keep If ncomponents is None then ncomponents is set to min(nsamples, nfeatures)

whiten bool optional When True False by default the components vectors are divided by $\sqrt{\text{nsamples} \times \text{variance}}$ to ensure uncorrelated outputs with unit componentwise variances

Whitening will remove some information from the transformed signal the relative variance scales of the components but can sometimes improve the predictive accuracy of the downstream estimators by making data respect some hardwired assumptions

copy bool default=True If False X will be overwritten copy=False can be used to save memory but is unsafe for general use

batchsize int or None default=None The number of samples to use for each batch Only used when calling fit If batchsize is None then batchsize is inferred from the data and set to $\sqrt{\text{nfeatures}}$ to provide a balance between approximation accuracy and memory consumption

Attributes

components array shape (ncomponents, nfeatures) Components with maximum variance explained
variance array shape (ncomponents,) Variance explained by each of the selected components

explained_variance_ratio array shape (ncomponents,) Percentage of variance explained by each of the selected components If all components are stored the sum of explained variances is equal to 1.0

singular_values array shape (ncomponents,) The singular values corresponding to each of the selected components The singular values are equal to the $\sqrt{2}$ norms of the ncomponents variables in the lower dimensional space

mean array shape (nfeatures,) Per feature empirical mean aggregate over calls to partial_fit

1632 Chapter 6 API (Application Programming Interface) Reference

scikitlearn user guide Release 0213

var array shape nfeatures Perfeature empirical variance aggregate over calls to partialfit

noisevariance float The estimated noise covariance following the Probabilistic PCA (Principal Component Analysis) model from Tipping and Bishop 1999 See “Pattern Recognition and Machine Learning” by C Bishop 1221 p 574 or <http://www.miketipping.com/papers/metmppcapdf>

ncomponents int The estimated number of components Relevant when ncomponents=None

nsamplesseen int The number of samples processed by the estimator Will be reset on new calls to fit but increments across partialfit calls

Notes

Implements the incremental PCA (Principal Component Analysis) model from D Ross J Lim R Lin M Yang Incremental Learning for Robust Visual Tracking International Journal of Computer Vision Volume 77 Issue 13 pp 125141 May 2008 See <https://www.cstor.utoronto.edu/drossi/vt/RossLimLinYangijcv.pdf>

This model is an extension of the Sequential KarhunenLoeve Transform from A Levy and M Lindenbaum Sequential KarhunenLoeve Basis Extraction and its Application to Images IEEE Transactions on Image Processing Volume 9 Number 8 pp 13711374 August 2000 See <https://www.cstechnion.ac.il/mic/docs/kl.pdf>

We have specifically abstained from an optimization used by authors of both papers a QR decomposition used in specific situations to reduce the algorithmic complexity of the SVD The source for this technique is Matrix Computations Third Edition G Golub and C Van Loan Chapter 5 section 544 pp 252253 This technique has been omitted because it is advantageous only when decomposing a matrix with nsamples rows 53 nfeatures columns and hurts the readability of the implemented algorithm This would be a good opportunity for future optimization if it is deemed necessary

scikitlearn user guide Release 0213

getparams selfdeepTrue
Get parameters for this estimator

Parameters

deep boolean optional If True will return the parameters for this estimator and contained subobjects that are estimators

Returns

params mapping of string to any Parameter names mapped to their values

getprecision self
Compute data precision matrix with the generative model
Equals the inverse of the covariance but computed with the matrix inversion lemma for efficiency

Returns

precision array shapenfeatures nfeatures Estimated precision of data

inversetransform selfX
Transform data back to its original space
In other words return an input Xoriginal whose transform would be X

Parameters

Xarraylike shape nsamples ncomponents New data where nsamples is the number of samples and ncomponents is the number of components

Returns

Xoriginal arraylike shape nsamples nfeatures

Notes

If whitening is enabled inversetransform will compute the exact inverse operation which includes reversing whitening

partialfit selfXyNone checkinputTrue
Incremental fit with X All of X is processed as a single batch

Parameters

Xarraylike shape nsamples nfeatures Training data where nsamples is the number of samples and nfeatures is the number of features

checkinput bool Run checkarray on X

ylgnored

Returns

self object Returns the instance itself

setparams selfparams
Set the parameters of this estimator
The method works on simple estimators as well as on nested objects such as pipelines The latter have parameters of the form componentparameter so that it's possible to update each component of a nested object

Returns

69sklearn decomposition Matrix Decomposition 1635

self
transform selfX
Apply dimensionality reduction to X
X is projected on the first principal components previously extracted from a training set
Parameters
Xarraylike shape nsamples nfeatures New data where nsamples is the number of samples and nfeatures is the number of features
Returns
Xnew arraylike shape nsamples ncomponents
Examples
import numpy as np
from sklearn.decomposition import IncrementalPCA
X = np.array([1, 2, 1, 3, 2, 1, 1, 2, 1, 3, 2])
ipca = IncrementalPCA(ncomponents=2, batchsize=3)
ipca.fit(X)
IncrementalPCA(batchsize=3, copy=True, ncomponents=2, whiten=False)
ipca.transform(X)

•Incremental PCA (Principal Component Analysis)
695sklearn.decomposition.KernelPCA
class sklearn.decomposition.KernelPCA(ncomponents=None, kernel='linear', gamma=None, degree=3, coef0=1, kernel_params=None, alpha=10, fit_inverse_transform=False, eigensolver='auto', tol=0, max_iter=None, remove_zero_eig=False, random_state=None, copy_X=True, n_jobs=None)
Kernel Principal component analysis KPCA
Nonlinear dimensionality reduction through the use of kernels see Pairwise metrics Affinities and Kernels
Read more in the User Guide
Parameters
ncomponents int default=None Number of components If None all nonzero components are kept
kernel "linear" "poly" "rbf" "sigmoid" "cosine" "precomputed" Kernel De fault "linear"
gamma float default=1 Kernel coefficient for rbf poly and sigmoid kernels Ig nored by other kernels
degree int default=3 Degree for poly kernels Ignored by other kernels
coef0 float default=1 Independent term in poly and sigmoid kernels Ignored by other kernels
1636 Chapter 6 API (Application Programming Interface) Reference

scikitlearn user guide Release 0213

kernelparams mapping of string to any defaultNone Parameters keyword arguments and values for kernel passed as callable object Ignored by other kernels

alpha int default10 Hyperparameter of the ridge regression that learns the inverse transform when fitinversetransformTrue

fitinversetransform bool defaultFalse Learn the inverse transform for nonprecomputed kernels ie learn to find the preimage of a point

eigensolver string ‘auto’‘dense’‘arpack’ default‘auto’ Select eigensolver to use If ncomponents is much less than the number of training samples arpack may be more efficient than the dense eigensolver

tolfloat default0 Convergence tolerance for arpack If 0 optimal value will be chosen by arpack

maxiter int defaultNone Maximum number of iterations for arpack If None optimal value will be chosen by arpack

removezeroeig boolean defaultFalse If True then all components with zero eigenvalues are removed so that the number of components in the output may be ncomponents and sometimes even zero due to numerical instability When ncomponents is None this parameter is ignored and components with zero eigenvalues are removed regardless

randomstate int RandomState instance or None optional defaultNone If int randomstate is the seed used by the random number generator If RandomState instance randomstate is the random number generator If None the random number generator is the RandomState instance used by nprandom Used when eigensolver ‘arpack’

New in version 018

copyX boolean defaultTrue If True input X is copied and stored by the model in the Xfit attribute If no further changes will be done to X setting copyXFalse saves memory by storing a reference

New in version 018

njobs int or None optional defaultNone The number of parallel jobs to run None means 1 unless in a joblibparallelbackend context1means using all processors See Glossary for more details

New in version 018

Attributes

lambdas array ncomponents Eigenvalues of the centered kernel matrix in decreasing order If ncomponents andremovezeroeig are not set then all values are stored

alphas array nsamples ncomponents Eigenvectors of the centered kernel matrix If ncomponents andremovezeroeig are not set then all components are stored

dualcoef array nsamples nfeatures Inverse transform matrix Only available when fitinversetransform is True

Xtransformedfit array nsamples ncomponents Projection of the fitted data on the kernel principal components Only available when fitinversetransform is True

Xfit nsamples nfeatures The data used to fit the model If copyXFalse then Xfit is a reference This attribute is used for the calls to transform

domstate=None
Latent Dirichlet Allocation with online variational Bayes algorithm
New in version 0.17
Read more in the User Guide
Parameters
ncomponents: int optional default=10 Number of topics
doctopicprior: float optional default=None Prior of document topic distribution θ
If the value is None defaults to $1/ncomponents$ In 1 this is called α
topicwordprior: float optional default=None Prior of topic word distribution β If
the value is None defaults to $1/ncomponents$ In 1 this is called η
learningmethod: 'batch' 'online' default='batch' Method used to update component
Only used in fit method In general if the data size is large the online update will be
much faster than the batch update
Valid options
batch Batch variational Bayes method Use all training data in
each EM update
Old components will be overwritten in each iteration
online Online variational Bayes method In each EM update use
minibatch of training data to update the components
variable incrementally The learning rate is controlled by the
learningdecay and the learningoffset parameters
Changed in version 0.20 The default learning method is now batch
learningdecay: float optional default=0.7 It is a parameter that control learning rate in the
online learning method The value should be set between 0.5 1.0 to guarantee asymptotic
convergence When the value is 0.0 and batchsize is nsamples the update method is
same as batch learning In the literature this is called κ
learningoffset: float optional default=10 A positive parameter that downweights early
iterations in online learning It should be greater than 10 In the literature this is called
 τ_0
maxiter: integer optional default=10 The maximum number of iterations
batchsize: int optional default=128 Number of documents to use in each EM iteration
Only used in online learning
1640 Chapter 6 API (Application Programming Interface) Reference

scikitlearn user guide Release 0213

`evaluateevery` int optional default0 How often to evaluate perplexity Only used in fit method set it to 0 or negative number to not evaluate perplexity in training at all Evaluating perplexity can help you check convergence in training process but it will also increase total training time Evaluating perplexity in every iteration might increase training time up to twofold

`totalsamples` int optional default1e6 Total number of documents Only used in the `partialfit` method

`perptol` float optional default1e1 Perplexity tolerance in batch learning Only used when `evaluateevery` is greater than 0

`meanchangetol` float optional default1e3 Stopping tolerance for updating document topic distribution in Estep

`maxdocupdateiter` int default100 Max number of iterations for updating document topic distribution in the Estep

`njobs` int or None optional defaultNone The number of jobs to use in the Estep None means 1 unless in a `joblibparallelbackend` context1means using all proces

sors See Glossary for more details

`verbose` int optional default0 Verbosity level

`randomstate` int RandomState instance or None optional defaultNone If int ran

domstate is the seed used by the random number generator If RandomState instance

randomstate is the random number generator If None the random number generator is the RandomState instance used by `nprandom`

Attributes

`components` array ncomponents nfeatures Variational parameters for topic word dis

tribution Since the complete conditional for topic word distribution is a Dirichlet

`components[i, j]` can be viewed as pseudocount that represents the number of times

`word[j]` was assigned to topic `i` It can also be viewed as distribution over the words

for each topic after normalization `model.components_` `model.components`

`sumaxis1` `np.newaxis`

`nbatchiter` int Number of iterations of the EM step

`niter` int Number of passes over the dataset

Minibatch Sparse Principal Components Analysis

Finds the set of sparse components that can optimally reconstruct the data. The amount of sparseness is controlled by the coefficient of the L1 penalty given by the parameter `alpha`.

Read more in the User Guide

Parameters

`ncomponents` int Number of sparse atoms to extract

`alpha` int Sparsity controlling parameter. Higher values lead to sparser components.

`ridge_alpha` float Amount of ridge shrinkage to apply in order to improve conditioning when calling the transform method.

`n_iter` int Number of iterations to perform for each mini batch.

`callback` callable or None optional default None callable that gets invoked every five iterations.

`batch_size` int the number of features to take in each mini batch.

`verbose` int Controls the verbosity: the higher, the more messages. Defaults to 0.

`shuffle` boolean whether to shuffle the data before splitting it in batches.

`n_jobs` int or None optional default None Number of parallel jobs to run. None means 1 unless in a `joblib.parallel_backend` context. 1 means using all processors. See Glossary for more details.

`method` 'lars' 'cd' 'lars' uses the least angle regression method to solve the lasso problem. 'linear_model.lars_path' 'cd' uses the coordinate descent method to compute the Lasso solution.

`linear_model.Lasso` 'lars' will be faster if the estimated components are sparse.

`random_state` int RandomState instance or None optional default None If int random

`state` is the seed used by the random number generator. If RandomState instance

`random_state` is the random number generator. If None the random number generator is the RandomState instance used by `np.random`.

`normalize_components` boolean optional default False

• if False use a version of Sparse PCA (Principal Component Analysis) without components normalization and without data centering. This is likely a bug and even though it's the default for backward compatibility this should not be used.

• if True use a version of Sparse PCA (Principal Component Analysis) with components normalization and data centering.

New in version 0.20

Deprecated since version 0.22 `normalize_components` was added and set to False

for backward compatibility. It would be set to True from 0.22 onwards.

Attributes

`components` array `ncomponents` `nfeatures` Sparse components extracted from the data.

ylgnored

Returns

```
69sklearn.decomposition Matrix Decomposition 1649
```

scikitlearn user guide Release 0213

self object Returns the instance itself

fittransform selfXyNone fitparams

Fit to data then transform it

Fits transformer to X and y with optional parameters fitparams and returns a transformed version of X

Parameters

Xnumpy array of shape nsamples nfeatures Training set

ynumpy array of shape nsamples Target values

Returns

Xnew numpy array of shape nsamples nfeaturesnew Transformed array

getparams selfdeepTrue

Get parameters for this estimator

Parameters

deep boolean optional If True will return the parameters for this estimator and contained

subobjects that are estimators

Returns

params mapping of string to any Parameter names mapped to their values

setparams selfparams

Set the parameters of this estimator

The method works on simple estimators as well as on nested objects such as pipelines The latter have

parameters of the form componentparameter so that it's possible to update each component

of a nested object

Returns

self

transform selfX

Least Squares projection of the data onto the sparse components

To avoid instability issues in case the system is underdetermined regularization can be applied Ridge

regression via the ridgealpha parameter

Note that Sparse PCA (Principal Component Analysis) components orthogonality is not enforced as in PCA (Principal Component Analysis) hence on

linear projection

Parameters

Xarray of shape nsamples nfeatures Test data to be transformed must have the same

number of features as the data used to train the model

Returns

Xnew array shape nsamples ncomponents Transformed data

•Selecting dimensionality reduction with Pipeline and GridSearchCV

•Faces dataset decompositions

6910sklearn.decomposition.PCA (Principal Component Analysis)

class sklearn.decomposition.PCA ncomponents=None copy=True whiten=False

svd_solver='auto' tol=0.0 iterated_power='auto' random_state=None

domstate=None

Principal component analysis PCA (Principal Component Analysis)

Linear dimensionality reduction using Singular Value Decomposition of the data to project it to a lower dimensional space The input data is centered but not scaled for each feature before applying the SVD

It uses the LAPACK implementation of the full SVD or a randomized truncated SVD by the method of Halko

et al 2009 depending on the shape of the input data and the number of components to extract

1654 Chapter 6 API (Application Programming Interface) Reference

scikitlearn user guide Release 0213

It can also use the scipysparselinalg ARPACK implementation of the truncated SVD

Notice that this class does not support sparse input See TruncatedSVD for an alternative with sparse data

Read more in the User Guide

Parameters

ncomponents int float None or string Number of components to keep if ncomponents is

not set all components are kept

ncomponents minnsamples nfeatures

Ifncomponents mle andsvdsolver full Minka’s MLE is used

to guess the dimension Use of ncomponents mle will interpret svdsolver

auto assvdsolver full

If0 ncomponents 1 andsvdsolver full select the number of

components such that the amount of variance that needs to be explained is greater than the

percentage specified by ncomponents

Ifsvdsolver arpack the number of components must be strictly less than the

minimum of nfeatures and nsamples

Hence the None case results in

ncomponents minnsamples nfeatures 1

copy bool default True If False data passed to fit are overwritten and running

fitXtransformX will not yield the expected results use fittransformX instead

whiten bool optional default False When True False by default the components vectors

are multiplied by the square root of nsamples and then divided by the singular values to

ensure uncorrelated outputs with unit componentwise variances

Whitening will remove some information from the transformed signal the relative variance

scales of the components but can sometime improve the predictive accuracy of the down

stream estimators by making their data respect some hardwired assumptions

svdsolver string ‘auto’ ‘full’ ‘arpack’ ‘randomized’

auto the solver is selected by a default policy based on Xshape andncomponents if

the input data is larger than 500x500 and the number of components to extract is lower

than 80 of the smallest dimension of the data then the more efficient ‘randomized’

method is enabled Otherwise the exact full SVD is computed and optionally truncated

afterwards

full run exact full SVD calling the standard LAPACK solver via scipylinalgsvd

and select the components by postprocessing

arpack run SVD truncated to ncomponents calling ARPACK solver via scipy

sparselinalgsvds It requires strictly 0 ncomponents minXshape

randomized run randomized SVD by the method of Halko et al

New in version 0180

tolfloat 0 optional default 0 Tolerance for singular values computed by svdsolver

‘arpack’

New in version 0180

69sklearnndecomposition Matrix Decomposition 1655

scikitlearn user guide Release 0213

iteratedpower int 0 or 'auto' default 'auto' Number of iterations for the power method computed by svdsolver 'randomized'

New in version 0180

randomstate int RandomState instance or None optional default None If int randomstate is the seed used by the random number generator If RandomState instance randomstate is the random number generator If None the random number generator is the RandomState instance used by nprandom Used when svdsolver 'arpack' or 'randomized'

New in version 0180

Attributes

components array shape ncomponents nfeatures Principal axes in feature space representing the directions of maximum variance in the data The components are sorted by explainedvariance

explainedvariance array shape ncomponents The amount of variance explained by each of the selected components

Equal to ncomponents largest eigenvalues of the covariance matrix of X

New in version 018

explainedvarianceratio array shape ncomponents Percentage of variance explained by each of the selected components

If ncomponents is not set then all components are stored and the sum of the ratios is equal to 10

singularvalues array shape ncomponents The singular values corresponding to each of the selected components The singular values are equal to the 2norms of the ncomponents variables in the lowerdimensional space

New in version 019

mean array shape nfeatures Perfeature empirical mean estimated from the training set Equal to Xmeanaxis0

ncomponents int The estimated number of components When ncomponents is set to 'mle' or a number between 0 and 1 with svdsolver 'full' this number is estimated from input data Otherwise it equals the parameter ncomponents or the lesser value of nfeatures and nsamples if ncomponents is None

noisevariance float The estimated noise covariance following the Probabilistic PCA (Principal Component Analysis) model from Tipping and Bishop 1999 See "Pattern Recognition and Machine Learning" by C Bishop 1221 p 574 or <http://www.miketipping.com/papers/metmppc.pdf> It is required to compute the estimated data covariance and score samples

Equal to the average of minnfeatures nsamples ncomponents smallest eigenvalues of the covariance matrix of X

Parameters

dictionary array ncomponents nfeatures The dictionary atoms used for sparse coding

Lines are assumed to be normalized to unit norm

transformalgorithm 'lassolars' 'lassocd' 'lars' 'omp' 'threshold' Algorithm used to

transform the data lars uses the least angle regression method linearmodellarspath

lassolars uses Lars to compute the Lasso solution lassoed uses the coordinate descent

method to compute the Lasso solution linearmodelLasso lassolars will be faster if

the estimated components are sparse omp uses orthogonal matching pursuit to estimate

the sparse solution threshold squashes to zero all coefficients less than alpha from the

projectiondictionary X

transformnnonzerocoefs int01nfeatures by default Number of nonzero

coefficients to target in each column of the solution This is only used by

algorithmmlars andalgorithmmomp and is overridden by alpha in the Or

thogonal Matching Pursuit OMP case

transformalpha float 1 by default If algorithmlassolars or

algorithmlassocd alpha is the penalty applied to the L1 norm If

algorithmthreshold alpha is the absolute value of the threshold below

which coefficients will be squashed to zero If algorithmmomp alpha is the

tolerance parameter the value of the reconstruction error targeted In this case it overrides

nnonzerocoefs

splitsign bool False by default Whether to split the sparse feature vector into the concate

nation of its negative part and its positive part This can improve the performance of down

stream classifiers

1664 Chapter 6 API (Application Programming Interface) Reference

scikitlearn user guide Release 0213

njobs int or None optional defaultNone Number of parallel jobs to run None means 1 unless in a joblibparallelbackend context1means using all processors See Glossary for more details

positivecode bool Whether to enforce positivity when finding the code

New in version 020

Methods

fitself X y Do nothing and return the estimator unchanged

fittransform self X y Fit to data then transform it

getparams self deep Get parameters for this estimator

setparams self params Set the parameters of this estimator

transform self X Encode the data as a sparse combination of the dictionary atoms

init selfdictionary transformalgorithm'omp' transformmnnonzerocoefsNone transformalphaNone splitsignFalse njobsNone positivecodeFalse

fitselfXyNone

Do nothing and return the estimator unchanged

This method is just there to implement the usual API (Application Programming Interface) and hence work in pipelines

Parameters

XIgnored

yIgnored

Returns

self object Returns the object itself

fittransform selfXyNone fitparams

Fit to data then transform it

Fits transformer to X and y with optional parameters fitparams and returns a transformed version of X

Parameters

Xnumpy array of shape nsamples nfeatures Training set

ynumpy array of shape nsamples Target values

Returns

69sklearnndecomposition Matrix Decomposition 1665

scikitlearn user guide Release 0213

Xnew numpy array of shape nsamples nfeaturesnew Transformed array

getparams selfdeepTrue

Get parameters for this estimator

Parameters

deep boolean optional If True will return the parameters for this estimator and contained

subobjects that are estimators

Returns

params mapping of string to any Parameter names mapped to their values

setparams selfparams

Set the parameters of this estimator

The method works on simple estimators as well as on nested objects such as pipelines The latter have

parameters of the form componentparameter so that it's possible to update each component

of a nested object

Returns

self

transform selfX

Encode the data as a sparse combination of the dictionary atoms

Coding method is determined by the object parameter transformalgorithm

Parameters

Xarray of shape nsamples nfeatures Test data to be transformed must have the same

number of features as the data used to train the model

Returns

Xnew array shape nsamples ncomponents Transformed data

Examples using sklearncompositionSparseCoder

•Sparse coding with a precomputed dictionary

6913sklearncomposition TruncatedSVD

classsklearncomposition TruncatedSVD ncomponents2 algorithm'randomized'

niter5 randomstateNone tol00

Dimensionality reduction using truncated SVD aka LSA

This transformer performs linear dimensionality reduction by means of truncated singular value decomposition

SVD Contrary to PCA (Principal Component Analysis) this estimator does not center the data before computing the singular value decompo

sition This means it can work with scipysparse matrices efficiently

In particular truncated SVD works on term counttfidf matrices as returned by the vectorizers in

sklearnfeatureextractiontext In that context it is known as latent semantic analysis LSA

This estimator supports two algorithms a fast randomized SVD solver and a "naive" algorithm that uses

ARPACK as an eigensolver on X XT or XT X whichever is more efficient

Read more in the User Guide

Parameters

1666 Chapter 6 API (Application Programming Interface) Reference

scikitlearn user guide Release 0213

ncomponents int default 2 Desired dimensionality of output data Must be strictly less than the number of features The default value is useful for visualisation For LSA a value of 100 is recommended

algorithm string default "randomized" SVD solver to use Either "arpack" for the ARPACK wrapper in SciPy scipyparselinalgsvds or "randomized" for the randomized algorithm due to Halko 2009

niter int optional default 5 Number of iterations for randomized SVD solver Not used by ARPACK The default is larger than the default in randomizedsvd to handle sparse matrices that may have large slowly decaying spectrum

randomstate int RandomState instance or None optional default None If int randomstate is the seed used by the random number generator If RandomState instance randomstate is the random number generator If None the random number generator is the RandomState instance used by np.random

tol float optional Tolerance for ARPACK 0 means machine precision Ignored by randomized SVD solver

Attributes

components array shape ncomponents nfeatures

explainedvariance array shape ncomponents The variance of the training samples transformed by a projection to each component

explainedvarianceratio array shape ncomponents Percentage of variance explained by each of the selected components

singularvalues array shape ncomponents The singular values corresponding to each of the selected components The singular values are equal to the 2-norms of the ncomponents variables in the lowerdimensional space

See also

PCA (Principal Component Analysis)

Notes

SVD suffers from a problem called "sign indeterminacy" which means the sign of the components and the output from transform depend on the algorithm and random state To work around this fit instances of this class to data once then keep the instance around to do transformations

winit=None randomstate=None returnXmean=False

computesources=True returnniter=False

Perform Fast Independent Component Analysis

Read more in the User Guide

Parameters

Xarraylike shape nsamples nfeatures Training vector where nsamples is the number of samples and nfeatures is the number of features

ncomponents int optional Number of components to extract If None no dimension reduction is performed

algorithm 'parallel' 'deflation' optional Apply a parallel or deflational FASTICA algorithm

whiten boolean optional If True perform an initial whitening of the data If False the data is assumed to have already been preprocessed it should be centered normed and white Otherwise you will get incorrect results In this case the parameter ncomponents will be ignored

fun string or function optional Default 'logcosh' The functional form of the G function used in the approximation to negentropy Could be either 'logcosh' 'exp' or 'cube' You can also provide your own function It should return a tuple containing the value of the function and of its derivative in the point The derivative should be averaged along its last dimension Example

```
def mygx return x 3 np.mean(x 2 axis=1)
```

funargs dictionary optional Arguments to send to the functional form If empty or None and if fun'logcosh' funargs will take value 'alpha' 10

maxiter int optional Maximum number of iterations to perform

tol float optional A positive scalar giving the tolerance at which the unmixing matrix is considered to have converged

winit ncomponents ncomponents array optional Initial unmixing array of dimension ncomponents

randomstate int RandomState instance or None optional default=None If int randomstate is the seed used by the random number generator If RandomState instance randomstate is the random number generator If None the random number generator is the RandomState instance used by np.random

returnXmean bool optional If True Xmean is returned too

computesources bool optional If False sources are not computed but only the rotation matrix This can save memory when working with big data Defaults to True

returnniter bool optional Whether or not to return the number of iterations

Returns

Karray shape ncomponents nfeatures None If whiten is 'True' K is the prewhitening matrix that projects data onto the first ncomponents principal components If whiten is 'False' K is 'None'

69sklearn.decomposition Matrix Decomposition 1673

scikitlearn user guide Release 0213

Warray shape ncomponents ncomponents Estimated unmixing matrix The mixing matrix can be obtained by

w npdotW KT

A wT wwTl

Sarray shape nsamples ncomponents None Estimated source matrix

Xmean array shape nfeatures The mean over features Returned only if returnXmean is True

niter int If the algorithm is “deflation” niter is the maximum number of iterations run across all components Else they are just the number of iterations taken to converge This is returned only when returnniter is set to True

Notes

The data matrix X is considered to be a linear combination of nonGaussian independent components ie X

AS where columns of S contain the independent components and A is a linear mixing matrix In short ICA attempts to unmix the data by estimating an unmixing matrix W where S W

K X

This implementation was originally made for data of shape nfeatures nsamples Now the input is transposed before the algorithm is applied This makes it slightly faster for Fortranordered input

Implemented using FastICA A Hyvarinen and E Oja Independent Component Analysis Algorithms and

randomstateNone verbose0

shuffleFalse

Compute Nonnegative Matrix Factorization NMF (Non-Negative Matrix Factorization)

Find two nonnegative matrices W H whose product approximates the non negative matrix X This factorization can be used for example for dimensionality reduction source separation or topic extraction

The objective function is

05X WHFro2

alpha l1ratio vecW1

alpha l1ratio vecH1

05alpha1 l1ratio WFro2

05alpha1 l1ratio HFro2

Where

AFro2 sumij Aij2 Frobenius norm

vecA1 sumij absAij Elementwise L1 norm

1674 Chapter 6 API (Application Programming Interface) Reference

scikitlearn user guide Release 0213

For multiplicativeupdate 'mu' solver the Frobenius norm $\|X - WH\|_F^2$ can be changed into another betadivergence loss by changing the betaloss parameter

The objective function is minimized with an alternating minimization of W and H If H is given and updateH=False it solves for W only

Parameters

Xarraylike shape nsamples nfeatures Constant matrix

Warraylike shape nsamples ncomponents If init='custom' it is used as initial guess for the solution

Harraylike shape ncomponents nfeatures If init='custom' it is used as initial guess for the solution If updateH=False it is used as a constant to solve for W only

ncomponents integer Number of components if ncomponents is not set all features are kept

init None 'random' 'nndsvd' 'nndsvda' 'nndsvdar' 'custom' Method used to initialize the procedure Default 'random'

The default value will change from 'random' to None in version 023 to make it consistent with decompositionNMF

Valid options

- None 'nndsvd' if ncomponents < nfeatures otherwise 'random'
- 'random' nonnegative random matrices scaled with sqrt(X.mean(ncomponents))

• 'nndsvd' Nonnegative Double Singular Value Decomposition NNDSVD

initialization better for sparseness

• 'nndsvda' NNDSVD with zeros filled with the average of X better when sparsity is not desired

• 'nndsvdar' NNDSVD with zeros filled with small random values generally faster

less accurate alternative to NNDSVDa for when sparsity is not desired

• 'custom' use custom matrices W and H

updateH boolean default True Set to True both W and H will be estimated from initial

guesses Set to False only W will be estimated

solver 'cd' 'mu' Numerical solver to use 'cd' is a Coordinate Descent solver that uses Fast Hierarchical

Alternating Least Squares Fast HALS

'mu' is a Multiplicative Update solver

New in version 017 Coordinate Descent solver

New in version 019 Multiplicative Update solver

betaloss float or string default 'frobenius' String must be in 'frobenius' 'kullbackleibler'

'itakurasaito' Beta divergence to be minimized measuring the distance between X and

the dot product WH Note that values different from 'frobenius' or 2 and 'kullbackleibler'

or 1 lead to significantly slower fits Note that for betaloss 0 or 'itakurasaito' the

input matrix X cannot contain zeros Used only in 'mu' solver

New in version 019

tolfloat default 1e-4 Tolerance of the stopping condition

69sklearn.decomposition Matrix Decomposition 1675

scikitlearn user guide Release 0213

maxiter integer default 200 Maximum number of iterations before timing out

alpha double default 0 Constant that multiplies the regularization terms

l1ratio double default 0 The regularization mixing parameter with 0 l1ratio = 1 For l1ratio = 0 the penalty is an elementwise L2 penalty aka Frobenius Norm For l1ratio = 1 it is an elementwise L1 penalty For 0 < l1ratio < 1 the penalty is a combination of L1 and L2

regularization 'both' 'components' 'transformation' None Select whether the regularization affects the components H the transformation W both or none of them

randomstate int RandomState instance or None optional default None If int ran

domstate is the seed used by the random number generator If RandomState instance

randomstate is the random number generator If None the random number generator is the RandomState instance used by np.random

verbose integer default 0 The verbosity level

shuffle boolean default False If true randomize the order of coordinates in the CD solver

Returns

Warraylike shape nsamples ncomponents Solution to the nonnegative least squares problem

Harraylike shape ncomponents nfeatures Solution to the nonnegative least squares problem

niter int Actual number of iterations

tol00001

Linear Discriminant Analysis

A classifier with a linear decision boundary generated by fitting class conditional densities to the data and using Bayes' rule

The model fits a Gaussian density to each class assuming that all classes share the same covariance matrix

The fitted model can also be used to reduce the dimensionality of the input by projecting it to the most discriminative directions

New in version 017 LinearDiscriminantAnalysis

Read more in the User Guide

Parameters

solver string optional

Solver to use possible values

- 'svd' Singular value decomposition default Does not compute the covariance matrix therefore this solver is recommended for data with a large number of features

- 'lsqr' Least squares solution can be combined with shrinkage

- 'eigen' Eigenvalue decomposition can be combined with shrinkage

shrinkage string or float optional

Shrinkage parameter possible values

1678 Chapter 6 API (Application Programming Interface) Reference

scikitlearn user guide Release 0213

- None no shrinkage default
- 'auto' automatic shrinkage using the LedoitWolf lemma
- float between 0 and 1 fixed shrinkage parameter

Note that shrinkage works only with 'lsqr' and 'eigen' solvers

priors array optional shape nclasses Class priors

ncomponents int optional defaultNone Number of components minnclasses

1 nfeatures for dimensionality reduction If None will be set to minnclasses 1

nfeatures

storecovariance bool optional Additionally compute class covariance matrix default

False used only in 'svd' solver

New in version 017

tolfloat optional default 10e4 Threshold used for rank estimation in SVD solver

New in version 017

Attributes

nant Analysis

Notes

The default solver is 'svd' It can perform both classification and transform and it does not rely on the calcu

lation of the covariance matrix This can be an advantage in situations where the number of features is large

However the 'svd' solver cannot be used with shrinkage

The 'lsqr' solver is an efficient algorithm that only works for classification It supports shrinkage

The 'eigen' solver is based on the optimization of the between class scatter to within class scatter ratio It can

be used for both classification and transform and it supports shrinkage However the 'eigen' solver needs to

compute the covariance matrix so it might not be suitable for situations with a high number of features

610sklearnndiscriminantanalysis Discriminant Analysis 1679

scikitlearn user guide Release 0213

Examples

```
import numpy as np
from sklearn.discriminantanalysis import LinearDiscriminantAnalysis
X = np.array([1, 2, 1, 3, 2, 1, 1, 2, 1, 3, 2])
y = np.array([1, 1, 1, 2, 2, 2])
clf = LinearDiscriminantAnalysis()
clf.fit(X, y)
LinearDiscriminantAnalysis(n_components=None, priors=None, shrinkage=None,
solver='svd', store_covariance=False, tol=0.0001)
print(clf.predict([0.8, 1.1]))
```

Methods

`decisionfunction` self X Predict confidence scores for samples

`transform` self X Project data to maximize class separation
`__init__` self solver='svd' shrinkage=None priors=None n_components=None store_covariance=False tol=0.0001
`decisionfunction` self X
Predict confidence scores for samples
The confidence score for a sample is the signed distance of that sample to the hyperplane
Parameters
X array-like or sparse matrix shape (n_samples, n_features) Samples
Returns
array shape (n_samples, n_classes - 1) Confidence scores per sample class combination In the binary case confidence score for self.classes_[1] where 0 means this class would be predicted

`fit` self X y Fit LinearDiscriminantAnalysis model according to the given training data and parameters
Changed in version 0.19 store_covariance has been moved to main constructor
Changed in version 0.19 tol has been moved to main constructor

Parameters

X array-like shape (n_samples, n_features) Training data
1680 Chapter 6 API (Application Programming Interface) Reference

scikitlearn user guide Release 0213

array shape nsamples Target values

fittransform selfXyNone fitparams

Fit to data then transform it

Fits transformer to X and y with optional parameters fitparams and returns a transformed version of X

Parameters

Xnumpy array of shape nsamples nfeatures Training set

ynumpy array of shape nsamples Target values

Returns

Xnew numpy array of shape nsamples nfeaturesnew Transformed array

getparams selfdeepTrue

Get parameters for this estimator

Parameters

deep boolean optional If True will return the parameters for this estimator and contained

subobjects that are estimators

Returns

params mapping of string to any Parameter names mapped to their values

predictselfX

Predict class labels for samples in X

Parameters

Xarraylike or sparse matrix shape nsamples nfeatures Samples

Returns

Carray shape nsamples Predicted class label per sample

predictlogproba selfX

Estimate log probability

Parameters

Xarraylike shape nsamples nfeatures Input data

Returns

Carray shape nsamples nclasses Estimated log probabilities

predictproba selfX

Estimate probability

Parameters

Xarraylike shape nsamples nfeatures Input data

Returns

Carray shape nsamples nclasses Estimated probabilities

scoreselfXysampleweightNone

Returns the mean accuracy on the given test data and labels

In multilabel classification this is the subset accuracy which is a harsh metric since you require for each sample that each label set be correctly predicted

610sklearndiscriminantanalysis Discriminant Analysis 1681

scikitlearn user guide Release 0213

Parameters

Xarraylike shape nsamples nfeatures Test samples

yarraylike shape nsamples or nsamples noutputs True labels for X

sampleweight arraylike shape nsamples optional Sample weights

Returns

score float Mean accuracy of selfpredictX wrt y

setparams selfparams

Set the parameters of this estimator

The method works on simple estimators as well as on nested objects such as pipelines The latter have parameters of the form componentparameter so that it's possible to update each component

of a nested object

Returns

self

transform selfX

Project data to maximize class separation

Parameters

Xarraylike shape nsamples nfeatures Input data

Returns

Xnew array shape nsamples ncomponents Transformed data

Examples using sklearndiscriminantanalysisLinearDiscriminantAnalysis

- Normal and Shrinkage Linear Discriminant Analysis for classification
- Linear and Quadratic Discriminant Analysis with covariance ellipsoid
- Comparison of LDA and PCA (Principal Component Analysis) 2D projection of Iris dataset
- Manifold learning on handwritten digits Locally Linear Embedding Isomap
- Dimensionality Reduction with Neighborhood Components Analysis

tol00001

Quadratic Discriminant Analysis

A classifier with a quadratic decision boundary generated by fitting class conditional densities to the data and using Bayes' rule

The model fits a Gaussian density to each class

New in version 017 QuadraticDiscriminantAnalysis

Read more in the User Guide

Parameters

1682 Chapter 6 API (Application Programming Interface) Reference

scikitlearn user guide Release 0213

priors array optional shape nclasses Priors on classes

regparam float optional Regularizes the covariance estimate as

1regparam Sigma regparam npeyenfeatures

storecovariance boolean If True the covariance matrices are computed and stored in the selfcovariance attribute

New in version 017

tolfloat optional default 10e4 Threshold used for rank estimation

New in version 017

Attributes

covariance list of arraylike shape nfeatures nfeatures Covariance matrices of each class

means arraylike shape nclasses nfeatures Class means

priors arraylike shape nclasses Class priors sum to 1

rotations list of arrays For each class k an array of shape nfeatures nk with nk minnfeatures number of elements in class k It is the rotation of the Gaussian distribution ie its principal axis

scalings list of arrays For each class k an array of shape nk It contains the scaling of the Gaussian distributions along its principal axes ie the variance in the rotated coordinate system

`setparams` self params Set the parameters of this estimator

`init` selfpriorsNone regparam00 storecovarianceFalse tol000001

`decisionfunction` selfX

Apply decision function to an array of samples

Parameters

Xarraylike shape nsamples nfeatures Array of samples test vectors

Returns

Carray shape nsamples nclasses or nsamples Decision function values related to each class per sample In the twoclass case the shape is nsamples giving the log likelihood ratio of the positive class

`fitselfXy`

Fit the model according to the given training data and parameters

Changed in version 019 storecovariances has been moved to main constructor as storecovariance

Changed in version 019 tol has been moved to main constructor

Parameters

Xarraylike shape nsamples nfeatures Training vector where nsamples is the number of samples and nfeatures is the number of features

yarray shape nsamples Target values integers

`getparams` selfdeepTrue

Get parameters for this estimator

Parameters

deep boolean optional If True will return the parameters for this estimator and contained subobjects that are estimators

Returns

params mapping of string to any Parameter names mapped to their values

`predictselfX`

Perform classification on an array of test vectors X

The predicted class C for each sample in X is returned

Parameters

Xarraylike shape nsamples nfeatures

Returns

Carray shape nsamples

scikitlearn user guide Release 0213

predictlogproba selfX

Return posterior probabilities of classification

Parameters

Xarraylike shape nsamples nfeatures Array of samplestest vectors

Returns

Carray shape nsamples nclasses Posterior logprobabilities of classification per class

predictproba selfX

Return posterior probabilities of classification

Parameters

Xarraylike shape nsamples nfeatures Array of samplestest vectors

Returns

Carray shape nsamples nclasses Posterior probabilities of classification per class

scoreselfXysampleweightNone

Returns the mean accuracy on the given test data and labels

In multilabel classification this is the subset accuracy which is a harsh metric since you require for each sample that each label set be correctly predicted

Parameters

Xarraylike shape nsamples nfeatures Test samples

yarraylike shape nsamples or nsamples noutputs True labels for X

sampleweight arraylike shape nsamples optional Sample weights

611sklearndummy Dummy estimators 1685

scikitlearn user guide Release 0213

dummyDummyClassifier strategy DummyClassifier is a classifier that makes predictions using simple rules

dummyDummyRegressor strategy constant DummyRegressor is a regressor that makes predictions using simple rules

6111sklearndummy DummyClassifier

classsklearndummy DummyClassifier strategy'stratifed' randomstateNone constantNone DummyClassifier is a classifier that makes predictions using simple rules

This classifier is useful as a simple baseline to compare with other real classifiers Do not use it for real problems

Read more in the User Guide

Parameters

strategy str default"stratifed" Strategy to use to generate predictions

- "stratifed" generates predictions by respecting the training set's class distribution
 - "mostfrequent" always predicts the most frequent label in the training set
 - "prior" always predicts the class that maximizes the class prior like "mostfrequent"
- andpredictproba returns the class prior

- "uniform" generates predictions uniformly at random

- "constant" always predicts a constant label that is provided by the user This is useful for metrics that evaluate a nonmajority class

New in version 017 Dummy Classifier now supports prior fitting strategy using parameterprior

randomstate int RandomState instance or None optional defaultNone If int ran

domstate is the seed used by the random number generator If RandomState instance

randomstate is the random number generator If None the random number generator is the RandomState instance used by nprandom

constant int or str or array of shape noutputs The explicit constant as predicted by the "constant" strategy This parameter is useful only for the "constant" strategy

Attributes

classes array or list of array of shape nclasses Class labels for each output

nclasses array or list of array of shape nclasses Number of label for each output

classprior array or list of array of shape nclasses Probability of each class for each output

noutputs int Number of outputs

sparseoutput bool True if the array returned from predict is to be in sparse CSC format Is automatically set to True if the input y is passed in sparse format

setparams self params Set the parameters of this estimator

init selfstrategy' stratified' randomstateNone constantNone

fitselfXysampleweightNone

Fit the random classifier

Parameters

Xarraylike object with finite length or shape Training data requires length nsamples

yarraylike shape nsamples or nsamples noutputs Target values

sampleweight arraylike of shape nsamples optional Sample weights

Returns

self object

getparams selfdeepTrue

Get parameters for this estimator

Parameters

deep boolean optional If True will return the parameters for this estimator and contained subobjects that are estimators

Returns

params mapping of string to any Parameter names mapped to their values

predictselfX

Perform classification on test vectors X

Parameters

Xarraylike object with finite length or shape Training data requires length nsamples

Returns

yarray shape nsamples or nsamples noutputs Predicted target values for X

predictlogproba selfX

Return log probability estimates for the test vectors X

Parameters

Xarraylike object with finite length or shape Training data requires length nsamples

Returns

Parraylike or list of arraylike of shape nsamples nclasses Returns the log probability of the sample for each class in the model where classes are ordered arithmetically for each output

611sklearndummy Dummy estimators 1687

scikitlearn user guide Release 0213

predictproba selfX

Return probability estimates for the test vectors X

Parameters

Xarraylike object with finite length or shape Training data requires length

nsamples

Returns

Parraylike or list of arraylike of shape nsamples nclasses Returns the probability of the sample for each class in the model where classes are ordered arithmetically for each output

scoreselfXysampleweightNone

Returns the mean accuracy on the given test data and labels

In multilabel classification this is the subset accuracy which is a harsh metric since you require for each sample that each label set be correctly predicted

Parameters

Xarraylike None Test samples with shape nsamples nfeatures or None Passing

None as test samples gives the same result as passing real test samples since DummyClassifier operates independently of the sampled observations

yarraylike shape nsamples or nsamples noutputs True labels for X

sampleweight arraylike shape nsamples optional Sample weights

Returns

score float Mean accuracy of selfpredictX wrt y

setparams selfparams

Set the parameters of this estimator

The method works on simple estimators as well as on nested objects such as pipelines The latter have parameters of the form componentparameter so that it's possible to update each component of a nested object

Returns

self

6112sklearnndummy DummyRegressor

classsklearnndummy DummyRegressor strategy'mean' constantNone quantileNone

DummyRegressor is a regressor that makes predictions using simple rules

This regressor is useful as a simple baseline to compare with other real regressors Do not use it for real problems

Read more in the User Guide

Parameters

strategy str Strategy to use to generate predictions

- "mean" always predicts the mean of the training set
- "median" always predicts the median of the training set
- "quantile" always predicts a specified quantile of the training set provided with the quantile parameter

1688 Chapter 6 API (Application Programming Interface) Reference

scikitlearn user guide Release 0213

- “constant” always predicts a constant value that is provided by the user
- constant int or float or array of shape noutputs The explicit constant as predicted by the “constant” strategy This parameter is useful only for the “constant” strategy
- quantile float in 00 10 The quantile to predict using the “quantile” strategy A quantile of 05 corresponds to the median while 00 to the minimum and 10 to the maximum

Attributes

constant float or array of shape noutputs Mean or median or quantile of the training targets or constant value given by the user

noutputs int Number of outputs

Methods

fitself X y sampleweight Fit the random regressor

getparams self deep Get parameters for this estimator

predict self X returnstd Perform classification on test vectors X

score self X y sampleweight Returns the coefficient of determination R2 of the prediction

setparams self params Set the parameters of this estimator

init selfstrategy‘mean’ constantNone quantileNone

fitselfXysampleweightNone

Fit the random regressor

Parameters

Xarraylike object with finite length or shape Training data requires length

nsamples

yarraylike shape nsamples or nsamples noutputs Target values

sampleweight arraylike of shape nsamples optional Sample weights

Returns

self object

getparams selfdeepTrue

Get parameters for this estimator

Parameters

deep boolean optional If True will return the parameters for this estimator and contained subobjects that are estimators

Returns

params mapping of string to any Parameter names mapped to their values

predictselfXreturnstdFalse

Perform classification on test vectors X

Parameters

Xarraylike object with finite length or shape Training data requires length

nsamples

611sklearndummy Dummy estimators 1689

scikitlearn user guide Release 0213

returnstd boolean optional Whether to return the standard deviation of posterior prediction All zeros in this case

Returns

yarray shape nsamples or nsamples noutputs Predicted target values for X

ystd array shape nsamples or nsamples noutputs Standard deviation of predictive distribution of query points

scoreselfXysampleweightNone

Returns the coefficient of determination R2 of the prediction

The coefficient R2 is defined as $1 - \frac{u}{v}$ where u is the residual sum of squares $y_{true} - y_{pred}$

2sum and v is the total sum of squares $y_{true} - y_{truemean}$ 2sum The best possible score

is 10 and it can be negative because the model can be arbitrarily worse A constant model that always

predicts the expected value of y disregarding the input features would get a R2 score of 00

Parameters

Xarraylike None Test samples with shape nsamples nfeatures or None For

some estimators this may be a precomputed kernel matrix instead shape nsamples

nsamplesfitted where nsamplesfitted is the number of samples used in the fitting

for the estimator Passing None as test samples gives the same result as passing real test

samples since DummyRegressor operates independently of the sampled observations

yarraylike shape nsamples or nsamples noutputs True values for X

sampleweight arraylike shape nsamples optional Sample weights

Returns

score float R2 of selfpredictX wrt y

setparams selfparams

Set the parameters of this estimator

The method works on simple estimators as well as on nested objects such as pipelines The latter have

parameters of the form componentparameter so that it's possible to update each component

of a nested object

Returns

self

ingrate10 algorithm'SAMMER' ran

domstateNone

An AdaBoost classifier

An AdaBoost 1 classifier is a metaestimator that begins by fitting a classifier on the original dataset and then fits additional copies of the classifier on the same dataset but where the weights of incorrectly classified instances are adjusted such that subsequent classifiers focus more on difficult cases

This class implements the algorithm known as AdaBoostSAMME 2

Read more in the User Guide

Parameters

baseestimator object optional defaultNone The base estimator from which the boosted

ensemble is built Support for sample weighting is required as well as proper

classes andnclasses attributes If None then the base estimator is

DecisionTreeClassifiermaxdepth1

nestimators integer optional default50 The maximum number of estimators at which

boosting is terminated In case of perfect fit the learning procedure is stopped early

learningrate float optional default1 Learning rate shrinks the contribution of each

classifier by learningrate There is a tradeoff between learningrate and

nestimators

algorithm 'SAMME' 'SAMMER' optional default'SAMMER' If 'SAMMER' then

use the SAMMER real boosting algorithm baseestimator must support calculation

of class probabilities If 'SAMME' then use the SAMME discrete boosting algorithm The

SAMMER algorithm typically converges faster than SAMME achieving a lower test error

with fewer boosting iterations

randomstate int RandomState instance or None optional defaultNone If int ran

`init` self`baseestimator``None` `nestimators``50` `learningrate``10` `algorithm`‘SAMMER’

`randomstate``None`

`decisionfunction` selfX

Compute the decision function of X

Parameters

Xarraylike sparse matrix of shape `nsamples nfeatures` The training input samples Sparse matrix can be CSC CSR (Compressed Sparse Row) COO DOK or LIL COO DOK and LIL are converted to CSR (Compressed Sparse Row)

Returns

score array shape `nsamples k` The decision function of the input samples The order of outputs is the same of that of the classes attribute Binary classification is a special cases with`k = 1` otherwise `knclasses` For binary classification values closer to 1 or -1 mean more like the first or second class in `classes` respectively

`featureimportances`

Return the feature importances the higher the more important the feature

Returns

`featureimportances` array shape `nfeatures`

`fitselfXysampleweight``None`

Build a boosted classifier from the training set X y

Parameters

Xarraylike sparse matrix of shape `nsamples nfeatures` The training input samples Sparse matrix can be CSC CSR (Compressed Sparse Row) COO DOK or LIL COO DOK and LIL are converted to CSR (Compressed Sparse Row)

yarraylike of shape `nsamples` The target values class labels

`sampleweight` arraylike of shape `nsamples` optional Sample weights If `None` the sample weights are initialized to 1 `nsamples`

Returns

self object

`getparams` self`deep``True`

Get parameters for this estimator

Parameters

612sklearnensemble Ensemble Methods 1693

scikitlearn user guide Release 0213

deep boolean optional If True will return the parameters for this estimator and contained subobjects that are estimators

Returns

params mapping of string to any Parameter names mapped to their values

predictselfX

Predict classes for X

The predicted class of an input sample is computed as the weighted mean prediction of the classifiers in the ensemble

Parameters

Xarraylike sparse matrix of shape nsamples nfeatures The training input samples Sparse matrix can be CSC CSR (Compressed Sparse Row) COO DOK or LIL COO DOK and LIL are converted to CSR (Compressed Sparse Row)

Returns

yarray of shape nsamples The predicted classes

predictlogproba selfX

Predict class logprobabilities for X

The predicted class logprobabilities of an input sample is computed as the weighted mean predicted class logprobabilities of the classifiers in the ensemble

Parameters

Xarraylike sparse matrix of shape nsamples nfeatures The training input samples Sparse matrix can be CSC CSR (Compressed Sparse Row) COO DOK or LIL COO DOK and LIL are converted to CSR (Compressed Sparse Row)

Returns

parray of shape nsamples nclasses The class probabilities of the input samples The order of outputs is the same of that of the classes attribute

predictproba selfX

Predict class probabilities for X

The predicted class probabilities of an input sample is computed as the weighted mean predicted class probabilities of the classifiers in the ensemble

Parameters

Xarraylike sparse matrix of shape nsamples nfeatures The training input samples Sparse matrix can be CSC CSR (Compressed Sparse Row) COO DOK or LIL COO DOK and LIL are converted to CSR (Compressed Sparse Row)

Returns

parray of shape nsamples nclasses The class probabilities of the input samples The order of outputs is the same of that of the classes attribute

scoreselfXysampleweightNone

Returns the mean accuracy on the given test data and labels

In multilabel classification this is the subset accuracy which is a harsh metric since you require for each sample that each label set be correctly predicted

Parameters

Xarraylike shape nsamples nfeatures Test samples

1694 Chapter 6 API (Application Programming Interface) Reference

scikitlearn user guide Release 0213

yarraylike shape nsamples or nsamples noutputs True labels for X

sampleweight arraylike shape nsamples optional Sample weights

Returns

score float Mean accuracy of selfpredictX wrt y

setparams selfparams

Set the parameters of this estimator

The method works on simple estimators as well as on nested objects such as pipelines The latter have

parameters of the form componentparameter so that it's possible to update each component

of a nested object

Returns

self

stageddecisionfunction selfX

Compute decision function of Xfor each boosting iteration

This method allows monitoring ie determine error on testing set after each boosting iteration

Parameters

Xarraylike sparse matrix of shape nsamples nfeatures The training input sam

ples Sparse matrix can be CSC CSR (Compressed Sparse Row) COO DOK or LIL COO DOK and LIL are

converted to CSR (Compressed Sparse Row)

Returns

score generator of array shape nsamples k The decision function of the input sam

ples The order of outputs is the same of that of the classes attribute Binary classification

is a special cases with k 1 otherwise knclasses For binary classification

values closer to 1 or 1 mean more like the first or second class in classes respectively

stagedpredict selfX

Return staged predictions for X

The predicted class of an input sample is computed as the weighted mean prediction of the classifiers in

the ensemble

This generator method yields the ensemble prediction after each iteration of boosting and therefore allows

monitoring such as to determine the prediction on a test set after each boost

Parameters

Xarraylike of shape nsamples nfeatures The input samples Sparse matrix can be

CSC CSR (Compressed Sparse Row) COO DOK or LIL COO DOK and LIL are converted to CSR (Compressed Sparse Row)

Returns

ygenerator of array shape nsamples The predicted classes

stagedpredictproba selfX

Predict class probabilities for X

The predicted class probabilities of an input sample is computed as the weighted mean predicted class

probabilities of the classifiers in the ensemble

This generator method yields the ensemble predicted class probabilities after each iteration of boosting

and therefore allows monitoring such as to determine the predicted class probabilities on a test set after

each boost

Parameters

612sklearnensemble Ensemble Methods 1695

scikitlearn user guide Release 0213

Xarraylike sparse matrix of shape nsamples nfeatures The training input samples Sparse matrix can be CSC CSR (Compressed Sparse Row) COO DOK or LIL COO DOK and LIL are converted to CSR (Compressed Sparse Row)

Returns
pgenerator of array shape nsamples The class probabilities of the input samples The order of outputs is the same of that of the classes attribute
stagedscore selfXysampleweightNone

Return staged scores for X y
This generator method yields the ensemble score after each iteration of boosting and therefore allows monitoring such as to determine the score on a test set after each boost

Parameters
Xarraylike sparse matrix of shape nsamples nfeatures The training input samples Sparse matrix can be CSC CSR (Compressed Sparse Row) COO DOK or LIL COO DOK and LIL are converted to CSR (Compressed Sparse Row)
yarraylike shape nsamples Labels for X
sampleweight arraylike shape nsamples optional Sample weights

Returns
zfloat

Returns

1698 Chapter 6 API (Application Programming Interface) Reference

scikitlearn user guide Release 0213

array of shape nsamples The predicted regression values

scoreselfXysampleweightNone

Returns the coefficient of determination R2 of the prediction

The coefficient R2 is defined as $1 - \frac{u}{v}$ where u is the residual sum of squares $y_{true} - y_{pred}$

2sum and v is the total sum of squares $y_{true} - y_{truemean}$ 2sum The best possible score

is 10 and it can be negative because the model can be arbitrarily worse A constant model that always

predicts the expected value of y disregarding the input features would get a R2 score of 00

Parameters

Xarraylike shape nsamples nfeatures Test samples For some estimators this may

be a precomputed kernel matrix instead shape nsamples nsamplesfitted where

nsamplesfitted is the number of samples used in the fitting for the estimator

yarraylike shape nsamples or nsamples noutputs True values for X

sampleweight arraylike shape nsamples optional Sample weights

Returns

score float R2 of selfpredictX wrt y

Notes

The R2 score used when calling score on a regressor will use multioutputuniformaverage

from version 023 to keep consistent with metricsr2score This will influence the score

method of all the multioutput regressors except for multioutputMultiOutputRegressor

To specify the default value manually and avoid the warning please either call metricsr2score

directly or make a custom scorer with metricsmakescorer the builtin scorer r2 uses

multioutputuniformaverage

setparams selfparams

Set the parameters of this estimator

The method works on simple estimators as well as on nested objects such as pipelines The latter have

parameters of the form componentparameter so that it's possible to update each component

of a nested object

Returns

self

stagedpredict selfX

Return staged predictions for X

The predicted regression value of an input sample is computed as the weighted median prediction of the

classifiers in the ensemble

This generator method yields the ensemble prediction after each iteration of boosting and therefore allows

monitoring such as to determine the prediction on a test set after each boost

Parameters

Xarraylike sparse matrix of shape nsamples nfeatures The training input sam

ples

Returns

ygenerator of array shape nsamples The predicted regression values

612sklearnensemble Ensemble Methods 1699

scikitlearn user guide Release 0213
stagedscore selfXysampleweightNone

Return staged scores for X y

This generator method yields the ensemble score after each iteration of boosting and therefore allows monitoring such as to determine the score on a test set after each boost

A Bagging classifier

A Bagging classifier is an ensemble metaestimator that fits base classifiers each on random subsets of the original dataset and then aggregate their individual predictions either by voting or by averaging to form a final prediction Such a metaestimator can typically be used as a way to reduce the variance of a blackbox estimator eg a decision tree by introducing randomization into its construction procedure and then making an ensemble out of it

This algorithm encompasses several works from the literature When random subsets of the dataset are drawn as random subsets of the samples then this algorithm is known as Pasting Rb1846455d0e51 If samples are drawn with replacement then the method is known as Bagging Rb1846455d0e52 When random subsets of the dataset are drawn as random subsets of the features then the method is known as Random Subspaces Rb1846455d0e53 Finally when base estimators are built on subsets of both samples and features then the method is known as Random Patches Rb1846455d0e54

Read more in the User Guide

Parameters

baseestimator object or None optional defaultNone The base estimator to fit on random subsets of the dataset If None then the base estimator is a decision tree

nestimators int optional default10 The number of base estimators in the ensemble

maxsamples int or float optional default10 The number of samples to draw from X to train each base estimator

- If int then draw maxsamples samples
- If float then draw maxsamples Xshape0 samples

1700 Chapter 6 API (Application Programming Interface) Reference

scikitlearn user guide Release 0213

maxfeatures int or float optional default10 The number of features to draw from X to train each base estimator

- If int then draw maxfeatures features
- If float then draw maxfeatures Xshape1 features

bootstrap boolean optional defaultTrue Whether samples are drawn with replacement If False sampling without replacement is performed

bootstrapfeatures boolean optional defaultFalse Whether features are drawn with replacement

oobscore bool optional defaultFalse Whether to use outofbag samples to estimate the generalization error

warmstart bool optional defaultFalse When set to True reuse the solution of the previous call to fit and add more estimators to the ensemble otherwise just fit a whole new ensemble See the Glossary

New in version 017 warmstart constructor parameter

njobs int or None optional defaultNone The number of jobs to run in parallel for both

fit and predict None means 1 unless in a joblibparallelbackend context

1means using all processors See Glossary for more details

randomstate int RandomState instance or None optional defaultNone If int ran

domstate is the seed used by the random number generator If RandomState instance

randomstate is the random number generator If None the random number generator is

the RandomState instance used by nprandom

verbose int optional default0 Controls the verbosity when fitting and predicting

Attributes

baseestimator estimator The base estimator from which the ensemble is grown

estimators list of estimators The collection of fitted base estimators

estimatorssamples list of arrays The subset of drawn samples for each base estimator

estimatorsfeatures list of arrays The subset of drawn features for each base estimator

classes array of shape nclasses The classes labels

nclasses int or list The number of classes

oobscore float Score of the training dataset obtained using an outofbag estimate

oobdecisionfunction array of shape nsamples nclasses Decision function computed

with outofbag estimate on the training set If nestimators is small it might

be possible that a data point was never left out during the bootstrap In this case

oobdecisionfunction might contain NaN

scikitlearn user guide Release 0213

getparams selfdeepTrue

Get parameters for this estimator

Parameters

deep boolean optional If True will return the parameters for this estimator and contained

subobjects that are estimators

Returns

params mapping of string to any Parameter names mapped to their values

predictselfX

Predict class for X

The predicted class of an input sample is computed as the class with the highest mean predicted probability

If base estimators do not implement a predictproba method then it resorts to voting

Parameters

Xarraylike sparse matrix of shape nsamples nfeatures The training input sam

ples Sparse matrices are accepted only if they are supported by the base estimator

Returns

yarray of shape nsamples The predicted classes

predictlogproba selfX

Predict class logprobabilities for X

The predicted class logprobabilities of an input sample is computed as the log of the mean predicted class

probabilities of the base estimators in the ensemble

Parameters

Xarraylike sparse matrix of shape nsamples nfeatures The training input sam

ples Sparse matrices are accepted only if they are supported by the base estimator

Returns

parray of shape nsamples nclasses The class logprobabilities of the input samples

The order of the classes corresponds to that in the attribute classes

predictproba selfX

Predict class probabilities for X

The predicted class probabilities of an input sample is computed as the mean predicted class probabilities

of the base estimators in the ensemble If base estimators do not implement a predictproba method

then it resorts to voting and the predicted class probabilities of an input sample represents the proportion

of estimators predicting each class

Parameters

Xarraylike sparse matrix of shape nsamples nfeatures The training input sam

ples Sparse matrices are accepted only if they are supported by the base estimator

Returns

parray of shape nsamples nclasses The class probabilities of the input samples The

order of the classes corresponds to that in the attribute classes

scoreselfXysampleweightNone

Returns the mean accuracy on the given test data and labels

In multilabel classification this is the subset accuracy which is a harsh metric since you require for each

sample that each label set be correctly predicted

6125sklearnensemble IsolationForest
classsklearnensemble IsolationForest nestimators100 maxsamples'auto' contamination'legacy' maxfeatures10 bootstrapFalse
njobsNone behaviour'old' randomstateNone
verbose0 warmstartFalse
Isolation Forest Algorithm

Return the anomaly score of each sample using the IsolationForest algorithm

The IsolationForest 'isolates' observations by randomly selecting a feature and then randomly selecting a split value between the maximum and minimum values of the selected feature Since recursive partitioning can be represented by a tree structure the number of splittings required to isolate a sample is equivalent to the path length from the root node to the terminating node This path length averaged over a forest of such random trees is a measure of normality and our decision function

612sklearnensemble Ensemble Methods 1707

scikitlearn user guide Release 0213

Random partitioning produces noticeably shorter paths for anomalies Hence when a forest of random trees collectively produce shorter path lengths for particular samples they are highly likely to be anomalies

Read more in the User Guide

New in version 018

Parameters

nestimators int optional default100 The number of base estimators in the ensemble

maxsamples int or float optional default"auto"

The number of samples to draw from X to train each base estimator

- If int then draw maxsamples samples
- If float then draw maxsamples Xshape0 samples
- If "auto" then maxsamplesmin256 nsamples

If maxsamples is larger than the number of samples provided all samples will be used for all trees no sampling

contamination float in 0 05 optional default01 The amount of contamination of the data set ie the proportion of outliers in the data set Used when fitting to define the threshold on the decision function If 'auto' the decision function threshold is determined as in the original paper

Changed in version 020 The default value of contamination will change from 01 in 020 toauto in 022

maxfeatures int or float optional default10 The number of features to draw from X to train each base estimator

- If int then draw maxfeatures features
- If float then draw maxfeatures Xshape1 features

bootstrap boolean optional defaultFalse If True individual trees are fit on random subsets of the training data sampled with replacement If False sampling without replacement is performed

njobs int or None optional defaultNone The number of jobs to run in parallel for both fit andpredict None means 1 unless in a joblibparallelbackend context

1means using all processors See Glossary for more details

behaviour str default'old' Behaviour of the decisionfunction which can be ei ther 'old' or 'new' Passing behaviournew makes the decisionfunction

change to match other anomaly detection algorithm API (Application Programming Interface) which will be the default be haviour in the future As explained in details in the offset attribute documentation

thedecisionfunction becomes dependent on the contamination parameter in such a way that 0 becomes its natural threshold to detect outliers

New in version 020 behaviour is added in 020 for backcompatibility purpose

Deprecated since version 020 behaviourold is deprecated in 020 and will not be possible in 022

Deprecated since version 022 behaviour parameter will be deprecated in 022 and re moved in 024

randomstate int RandomState instance or None optional defaultNone If int ran

domstate is the seed used by the random number generator If RandomState instance

1708 Chapter 6 API (Application Programming Interface) Reference

scikitlearn user guide Release 0213

randomstate is the random number generator If None the random number generator is the RandomState instance used by nprandom
verbose int optional default0 Controls the verbosity of the tree building process
warmstart bool optional defaultFalse When set to True reuse the solution of the previous call to fit and add more estimators to the ensemble otherwise just fit a whole new forest See the Glossary

New in version 021

Attributes

estimators list of DecisionTreeClassifier The collection of fitted subestimators
estimatorssamples list of arrays The subset of drawn samples for each base estimator
maxsamples integer The actual number of samples
offset float Offset used to define the decision function from the raw scores We have the relation
decisionfunction scoresamples offset Assuming behaviour 'new' offset is defined as follows When the contamination parameter is set to "auto" the offset is equal to 0.5 as the scores of inliers are close to 0 and the scores of outliers are close to 1 When a contamination parameter different than "auto" is provided the offset is defined in such a way we obtain the expected number of outliers samples with decision function 0 in training Assuming the behaviour parameter is set to 'old' we always have offset 0.5 making the decision function independent from the contamination parameter

Notes

The implementation is based on an ensemble of ExtraTreeRegressor The maximum depth of each tree is set to $\lceil \log_2 n \rceil$ where n is the number of samples used to build the tree see Liu et al 2008 for more details

decisionfunction selfX

Average anomaly score of X of the base classifiers

The anomaly score of an input sample is computed as the mean anomaly score of the trees in the forest

The measure of normality of an observation given a tree is the depth of the leaf containing this observation

which is equivalent to the number of splittings required to isolate this point In case of several observations

nleft in the leaf the average path length of a nleft samples isolation tree is added

Parameters

Xarraylike or sparse matrix shape nsamples nfeatures The input samples Internally

it will be converted to dtype=np.float32 and if a sparse matrix is provided to a sparse

csrmatrix

Returns

scores array shape nsamples The anomaly score of the input samples The lower the

more abnormal Negative scores represent outliers positive scores represent inliers

estimatorssamples

The subset of drawn samples for each base estimator

Returns a dynamically generated list of indices identifying the samples used for fitting each member of the

ensemble ie the inbag samples

Note the list is recreated at each call to the property in order to reduce the object memory footprint by

not storing the sampling data Thus fetching the property may be slower than expected

fitselfXyNone sampleweightNone

Fit estimator

Parameters

Xarraylike or sparse matrix shape nsamples nfeatures The input samples Use

dtype=np.float32 for maximum efficiency Sparse matrices are also supported use

sparse.csrmatrix for maximum efficiency

sampleweight arraylike shape nsamples or None Sample weights If None then

samples are equally weighted

ylgnored not used present for API (Application Programming Interface) consistency by convention

Returns

self object

fitpredict selfXyNone

Performs fit on X and returns labels for X

Returns 1 for outliers and 1 for inliers

Parameters

Xndarray shape nsamples nfeatures Input data

ylgnored not used present for API (Application Programming Interface) consistency by convention

Returns

yndarray shape nsamples 1 for inliers 1 for outliers

getparams selfdeepTrue

Get parameters for this estimator

Parameters

1710 Chapter 6 API (Application Programming Interface) Reference

scikitlearn user guide Release 0213

deep boolean optional If True will return the parameters for this estimator and contained subobjects that are estimators

Returns

params mapping of string to any Parameter names mapped to their values

predictselfX

Predict if a particular sample is an outlier or not

Parameters

Xarraylike or sparse matrix shape nsamples nfeatures The input samples Internally

it will be converted to dtype npfloat32 and if a sparse matrix is provided to a sparse

csr matrix

Returns

isinlier array shape nsamples For each observation tells whether or not 1 or 1 it

should be considered as an inlier according to the fitted model

scoresamples selfX

Opposite of the anomaly score defined in the original paper

The anomaly score of an input sample is computed as the mean anomaly score of the trees in the forest

The measure of normality of an observation given a tree is the depth of the leaf containing this observation

which is equivalent to the number of splittings required to isolate this point In case of several observations

nleft in the leaf the average path length of a nleft samples isolation tree is added

Parameters

Xarraylike or sparse matrix shape nsamples nfeatures The input samples

Returns

scores array shape nsamples The anomaly score of the input samples The lower the

more abnormal

setparams selfparams

Set the parameters of this estimator

The method works on simple estimators as well as on nested objects such as pipelines The latter have

parameters of the form componentparameter so that it's possible to update each component

of a nested object

Returns

self

Examples using sklearnensembleIsolationForest

•Comparing anomaly detection algorithms for outlier detection on toy datasets

•IsolationForest example

An ensemble of totally random trees

An unsupervised transformation of a dataset to a highdimensional sparse representation A datapoint is coded

according to which leaf of each tree it is sorted into Using a onehot encoding of the leaves this leads to a

binary coding with as many ones as there are trees in the forest

The dimensionality of the resulting representation is nout nestimators maxleafnodes

Ifmaxleafnodes None the number of leaf nodes is at most nestimators 2

maxdepth

Read more in the User Guide

Parameters

nestimators integer optional default10 Number of trees in the forest

Changed in version 020 The default value of nestimators will change from 10 in

version 020 to 100 in version 022

maxdepth integer optional default5 The maximum depth of each tree If None

then nodes are expanded until all leaves are pure or until all leaves contain less than

minsamplessplit samples

minsamplessplit int float optional default2 The minimum number of samples required

to split an internal node

- If int then consider minsamplessplit as the minimum number

- If float then minsamplessplit is a fraction and ceilminsamplessplit

nsamples is the minimum number of samples for each split

Changed in version 018 Added float values for fractions

minsamplesleaf int float optional default1 The minimum number of samples required

to be at a leaf node A split point at any depth will only be considered if it leaves at least

minsamplesleaf training samples in each of the left and right branches This may

have the effect of smoothing the model especially in regression

- If int then consider minsamplesleaf as the minimum number

- If float then minsamplesleaf is a fraction and ceilminsamplesleaf

nsamples is the minimum number of samples for each node

Changed in version 018 Added float values for fractions

minweightfractionleaf float optional default0 The minimum weighted fraction of the

sum total of weights of all the input samples required to be at a leaf node Samples have

equal weight when sampleweight is not provided

maxleafnodes int or None optional defaultNone Grow trees with maxleafnodes

in bestfirst fashion Best nodes are defined as relative reduction in impurity If None then

unlimited number of leaf nodes

1712 Chapter 6 API (Application Programming Interface) Reference

scikitlearn user guide Release 0213

minimpuritydecrease float optional default0 A node will be split if this split induces a decrease of the impurity greater than or equal to this value

The weighted impurity decrease equation is the following

N_t N impurity N_tR N_t rightimpurity

N_tL N_t leftimpurity

where N is the total number of samples N_t is the number of samples at the current node

N_tL is the number of samples in the left child and N_tR is the number of samples in

the right child

NN_tN_tR and NN_tL all refer to the weighted sum if sampleweight is passed

New in version 019

minimpuritysplit float default1e7 Threshold for early stopping in tree growth A node

will split if its impurity is above the threshold otherwise it is a leaf

Deprecated since version 019 minimpuritysplit has been deprecated in favor of

minimpuritydecrease in 019 The default value of minimpuritysplit

will change from 1e7 to 0 in 023 and it will be removed in 025 Use

minimpuritydecrease instead

sparseoutput bool optional defaultTrue Whether or not to return a sparse CSR (Compressed Sparse Row) matrix

as default behavior or to return a dense array compatible with dense pipeline operators

njobs int or None optional defaultNone The number of jobs to run in parallel for both

fit and predict None means 1 unless in a joblibparallelbackend context

1means using all processors See Glossary for more details

randomstate int RandomState instance or None optional defaultNone If int ran

domstate is the seed used by the random number generator If RandomState instance

randomstate is the random number generator If None the random number generator is

the RandomState instance used by nprandom

verbose int optional default0 Controls the verbosity when fitting and predicting

warmstart bool optional defaultFalse When set to True reuse the solution of the pre

vious call to fit and add more estimators to the ensemble otherwise just fit a whole new

forest See the Glossary

Attributes

estimators list of DecisionTreeClassifier The collection of fitted subestimators

applyselfX

Apply trees in the forest to X return leaf indices

Parameters

Xarraylike or sparse matrix shape nsamples nfeatures The input samples Inter

nally its dtype will be converted to dtype npfloat32 If a sparse matrix is provided

it will be converted into a sparse csr matrix

Returns

Xleaves arraylike shape nsamples nestimators For each datapoint x in X and for

each tree in the forest return the index of the leaf x ends up in

decisionpath selfX

Return the decision path in the forest

New in version 018

Parameters

Xarraylike or sparse matrix shape nsamples nfeatures The input samples Inter

nally its dtype will be converted to dtype npfloat32 If a sparse matrix is provided

it will be converted into a sparse csr matrix

Returns

indicator sparse csr array shape nsamples nnodes Return a node indicator matrix

where non zero elements indicates that the samples goes through the nodes

nnodesptr array of size nestimators 1 The columns from indica

tor nnodesptr in nodesptr i1 gives the indicator value for the ith estimator

featureimportances

Return the feature importances the higher the more important the feature

Returns

featureimportances array shape nfeatures The values of this array sum to 1 unless

all trees are single node trees consisting of only the root node in which case it will be an

array of zeros

fitselfXyNone sampleweightNone

Fit estimator

Parameters

Xarraylike or sparse matrix shapensamples nfeatures The input samples Use

dtype npfloat32 for maximum efficiency Sparse matrices are also supported use

sparse csr matrix for maximum efficiency

scikitlearn user guide Release 0213

sampleweight arraylike shape nsamples or None Sample weights If None then samples are equally weighted Splits that would create child nodes with net zero or negative weight are ignored while searching for a split in each node In the case of classification splits are also ignored if they would result in any single class carrying a negative weight in either child node

Returns

self object

fittransform selfXyNone sampleweightNone

Fit estimator and transform dataset

Parameters

Xarraylike or sparse matrix shapensamples nfeatures Input data used to build

forests Use dtype=np.float32 for maximum efficiency

sampleweight arraylike shape nsamples or None Sample weights If None then

samples are equally weighted Splits that would create child nodes with net zero or negative

weight are ignored while searching for a split in each node In the case of classification

splits are also ignored if they would result in any single class carrying a negative

weight in either child node

Returns

Xtransformed sparse matrix shapensamples nout Transformed dataset

getparams selfdeepTrue

Get parameters for this estimator

Parameters

deep boolean optional If True will return the parameters for this estimator and contained

subobjects that are estimators

Returns

params mapping of string to any Parameter names mapped to their values

setparams selfparams

Set the parameters of this estimator

The method works on simple estimators as well as on nested objects such as pipelines The latter have

parameters of the form componentparameter so that it's possible to update each component

of a nested object

Returns

self

transform selfX

Transform dataset

Parameters

Xarraylike or sparse matrix shapensamples nfeatures Input data to be transformed

Usedtype=np.float32 for maximum efficiency Sparse matrices are also supported

use sparsecsrmatrix for maximum efficiency

Returns

Xtransformed sparse matrix shapensamples nout Transformed dataset

clf1 = LogisticRegression(solver='lbfgs', multi_class='multinomial',
                           random_state=1)
clf2 = RandomForestClassifier(n_estimators=50, random_state=1)
clf3 = GaussianNB()
X = np.array([1, 2, 1, 3, 2, 1, 1, 2, 1, 3, 2])
y = np.array([1, 1, 1, 2, 2, 2])
ecf1 = VotingClassifier(estimators=
    [ ('clf1', clf1), ('rf', clf2), ('gnb', clf3) ], voting='hard')
ecf1.fit(X, y)
print(ecf1.predict(X))
# 1 1 1 2 2 2
np.array_equal(ecf1.named_estimators_[0].predict(X),
    ecf1.named_estimators_[0].predict(X))
True
ecf2 = VotingClassifier(estimators=
    [ ('clf1', clf1), ('rf', clf2), ('gnb', clf3) ], voting='soft')
ecf2.fit(X, y)
print(ecf2.predict(X))
# 1 1 1 2 2 2
ecf3 = VotingClassifier(estimators=
    [ ('clf1', clf1), ('rf', clf2), ('gnb', clf3) ], voting='soft', weights=[2, 1, 1],
    flatten_transform=True)
ecf3.fit(X, y)
print(ecf3.predict(X))
# 1 1 1 2 2 2
print(ecf3.transform(X).shape)
# 6 6
```

Methods

- `fit(self, X, y, sample_weight=None)` Fit the estimators
- `fit_transform(self, X, y)` Fit to data then transform it
- `get_params(self, deep=True)` Get the parameters of the ensemble estimator
- `predict(self, X)` Predict class labels for X
- `score(self, X, y, sample_weight=None)` Returns the mean accuracy on the given test data and labels
- `set_params(self, **params)` Setting the parameters for the ensemble estimator
- `transform(self, X)` Return class labels or probabilities for X for each estimator

init(self, estimators, voting='hard', weights=None, n_jobs=None, flatten_transform=True)
fit(self, X, y, sample_weight=None)
Fit the estimators

Parameters

612sklearn.ensemble Ensemble Methods 1717

scikitlearn user guide Release 0213

Xarraylike sparse matrix shape nsamples nfeatures Training vectors where nsamples is the number of samples and nfeatures is the number of features

yarraylike shape nsamples Target values

sampleweight arraylike shape nsamples or None Sample weights If None then samples are equally weighted Note that this is supported only if all underlying estimators support sample weights

Returns

self object

fittransform selfXyNone fitparams

Fit to data then transform it

Fits transformer to X and y with optional parameters fitparams and returns a transformed version of X

Parameters

Xnumpy array of shape nsamples nfeatures Training set

ynumpy array of shape nsamples Target values

Returns

Xnew numpy array of shape nsamples nfeaturesnew Transformed array

getparams selfdeepTrue

Get the parameters of the ensemble estimator

Parameters

deep bool Setting it to True gets the various estimators and the parameters of the estimators as well

predictselfX

Predict class labels for X

Parameters

Xarraylike sparse matrix shape nsamples nfeatures The input samples

Returns

maj arraylike shape nsamples Predicted class labels

predictproba

Compute probabilities of possible outcomes for samples in X

Parameters

Xarraylike sparse matrix shape nsamples nfeatures The input samples

Returns

avg arraylike shape nsamples nclasses Weighted average probability for each class

per sample

scoreselfXysampleweightNone

Returns the mean accuracy on the given test data and labels

In multilabel classification this is the subset accuracy which is a harsh metric since you require for each sample that each label set be correctly predicted

Parameters

Xarraylike shape nsamples nfeatures Test samples

1718 Chapter 6 API (Application Programming Interface) Reference

scikitlearn user guide Release 0213

yarraylike shape nsamples or nsamples noutputs True labels for X

sampleweight arraylike shape nsamples optional Sample weights

Returns

score float Mean accuracy of selfpredictX wrt y

setparams selfparams

Setting the parameters for the ensemble estimator

Valid parameter keys can be listed with getparams

Parameters

params keyword arguments Specific parameters using eg

setparamsparameternamenewvalue In addition to setting the parameters of

the ensemble estimator the individual estimators of the ensemble estimator can also be

set or replaced by setting them to None

Examples

In this example the RandomForestClassifier is removed clf1 LogisticRegression clf2 Random

ForestClassifier eclf VotingClassifierestimators'lr' clf1 'rf' clf2 eclfsetparamsrfNone

transform selfX

Return class labels or probabilities for X for each estimator

Parameters

Xarraylike sparse matrix shape nsamples nfeatures Training vectors where

nsamples is the number of samples and nfeatures is the number of features

Returns

probabilitiesorlabels

Ifvotingsoft andflattentransformTrue returns arraylike of shape

nclassifiers nsamples nclasses being class probabilities calculated by each clas

sifier

Ifvotingsoft and flattentransformFalse arraylike of shape

nclassifiers nsamples nclasses

Ifvotinghard arraylike of shape nsamples nclassifiers being class labels

predicted by each classifier

Examples using sklearnensembleVotingClassifier

•Plot the decision boundaries of a VotingClassifier

•Plot class probabilities calculated by the VotingClassifier

6128sklearnensemble VotingRegressor

classsklearnensemble VotingRegressor estimators weightsNone njobsNone

Prediction voting regressor for unfitted estimators

New in version 021

612sklearnensemble Ensemble Methods 1719

scikitlearn user guide Release 0213

A voting regressor is an ensemble metaestimator that fits base regressors each on the whole dataset It then averages the individual predictions to form a final prediction

Read more in the User Guide

Parameters

estimators list of string estimator tuples Invoking the fit method on the VotingRegressor will fit clones of those original estimators that will be stored in the class attribute selfestimators An estimator can be set to None ordrop usingsetparams

weights arraylike shape nregressors optional default'None' Sequence of weights float orint to weight the occurrences of predicted values before averaging Uses uniform weights if None

njobs int or None optional defaultNone The number of jobs to run in parallel in None means 1 unless in a joblibparallelbackend context1means using all processors See Glossary for more details

transform self X Return predictions for X for each estimator

init selfestimators weightsNone njobsNone

fitselfXysampleweightNone

Fit the estimators

Parameters

Xarraylike sparse matrix shape nsamples nfeatures Training vectors where

nsamples is the number of samples and nfeatures is the number of features

yarraylike shape nsamples Target values

sampleweight arraylike shape nsamples or None Sample weights If None then

samples are equally weighted Note that this is supported only if all underlying estimators

support sample weights

Returns

self object

fittransform selfXyNone fitparams

Fit to data then transform it

Fits transformer to X and y with optional parameters fitparams and returns a transformed version of X

Parameters

Xnumpy array of shape nsamples nfeatures Training set

ynumpy array of shape nsamples Target values

Returns

Xnew numpy array of shape nsamples nfeaturesnew Transformed array

getparams selfdeepTrue

Get the parameters of the ensemble estimator

Parameters

deep bool Setting it to True gets the various estimators and the parameters of the estimators

as well

predictselfX

Predict regression target for X

The predicted regression target of an input sample is computed as the mean predicted regression targets of

the estimators in the ensemble

Parameters

Xarraylike sparse matrix of shape nsamples nfeatures The input samples

Returns

yarray of shape nsamples The predicted values

scoreselfXysampleweightNone

Returns the coefficient of determination R2 of the prediction

The coefficient R2 is defined as $1 - \frac{u}{v}$ where u is the residual sum of squares $y_{true} - y_{pred}$

$2sum$ and v is the total sum of squares $y_{true} - y_{truemean}$ $2sum$ The best possible score

612sklearnensemble Ensemble Methods 1721

scikitlearn user guide Release 0213

is 10 and it can be negative because the model can be arbitrarily worse A constant model that always predicts the expected value of y disregarding the input features would get a R2 score of 00

Parameters

Xarraylike shape nsamples nfeatures Test samples For some estimators this may be a precomputed kernel matrix instead shape nsamples nsamplesfitted where nsamplesfitted is the number of samples used in the fitting for the estimator yarraylike shape nsamples or nsamples noutputs True values for X sampleweight arraylike shape nsamples optional Sample weights

Returns

score float R2 of selfpredictX wrt y

Notes

The R2 score used when calling score on a regressor will use multioutputuniformaverage from version 023 to keep consistent with metricsr2score This will influence the score method of all the multioutput regressors except for multioutputMultiOutputRegressor To specify the default value manually and avoid the warning please either call metricsr2score directly or make a custom scorer with metricsmakescorer the builtin scorer r2 uses multioutputuniformaverage setparams selfparams

Setting the parameters for the ensemble estimator

Valid parameter keys can be listed with getparams

Parameters

params keyword arguments Specific parameters using eg setparamsparameternamenewvalue In addition to setting the parameters of the ensemble estimator the individual estimators of the ensemble estimator can also be set or replaced by setting them to None

Examples

Histogrambased Gradient Boosting Regression Tree

This estimator is much faster than GradientBoostingRegressor for big datasets nsamples 10 000

The input data Xis prebinned into integervalued bins which considerably reduces the number of splitting

points to consider and allows the algorithm to leverage integerbased data structures For small sample sizes

GradientBoostingRegressor might be preferred since binning may lead to split points that are too

approximate in this setting

This implementation is inspired by LightGBM

Note This estimator is still experimental for now the predictions and the API (Application Programming Interface) might change without any

deprecation cycle To use it you need to explicitly import enablehistgradientboosting

explicitly require this experimental feature

from sklearnexperimental import enablehistgradientboosting noqa

now you can import normally from ensemble

from sklearnensemble import HistGradientBoostingClassifier

Parameters

loss 'leastsquares' optional default'leastsquares' The loss function to use in the boost

ing process Note that the "least squares" loss actually implements an "half least squares

loss" to simplify the computation of the gradient

learningrate float optional default01 The learning rate also known as shrinkage This

is used as a multiplicative factor for the leaves values Use 1for no shrinkage

maxiter int optional default100 The maximum number of iterations of the boosting pro

cess ie the maximum number of trees

maxleafnodes int or None optional default31 The maximum number of leaves for each

tree Must be strictly greater than 1 If None there is no maximum limit

maxdepth int or None optional defaultNone The maximum depth of each tree The

depth of a tree is the number of nodes to go from the root to the deepest leaf Must be

strictly greater than 1 Depth isn't constrained by default

minsamplesleaf int optional default20 The minimum number of samples per leaf For

small datasets with less than a few hundred samples it is recommended to lower this value

since only very shallow trees would be built

l2regularization float optional default0 The L2 regularization parameter Use 0for no

regularization default

612sklearnensemble Ensemble Methods 1723

scikitlearn user guide Release 0213

maxbins int optional default256 The maximum number of bins to use Before training each feature of the input array Xis binned into at most maxbins bins which allows for a much faster training stage Features with a small number of unique values may use less than maxbins bins Must be no larger than 256

scoring str or callable or None optional defaultNone Scoring parameter to use for early stopping It can be a single string see The scoring parameter defining model evaluation rules or a callable see Defining your scoring strategy from metric functions If None the estimator’s default scorer is used If scoringloss early stopping is checked wrt the loss value Only used if niternochange is not None

validationfraction int or float or None optional default01 Proportion or absolute size of training data to set aside as validation data for early stopping If None early stopping is done on the training data Only used if niternochange is not None

niternochange int or None optional defaultNone Used to determine when to “early stop” The fitting process is stopped when none of the last niternochange scores are better than the “niternochange 1”thtolast one up to some tolerance If None or 0 no earlystopping is done

tolfloat or None optional default1e7 The absolute tolerance to use when comparing scores during early stopping The higher the tolerance the more likely we are to early stop higher tolerance means that it will be harder for subsequent iterations to be considered an improvement upon the reference score

verbose int optional default0 The verbosity level If not zero print some information about the fitting process

randomstate int nprandomRandomStateInstance or None optional defaultNone Pseudorandom number generator to control the subsampling in the binning process and the trainvalidation data split if early stopping is enabled See randomstate

Attributes

niter int The number of iterations as selected by early stopping if niternochange is not None Otherwise it corresponds to maxiter

ntreesperiteration int The number of tree that are built at each iteration For regressors this is always 1

trainscore ndarray shape maxiter 1 The scores at each iteration on the training data The first entry is the score of the ensemble before the first iteration Scores are computed according to the scoring parameter If scoring is not ‘loss’ scores are computed on a subset of at most 10 000 samples Empty if no early stopping

validationsscore ndarray shape maxiter 1 The scores at each iteration on the held out validation data The first entry is the score of the ensemble before the first iteration Scores are computed according to the scoring parameter Empty if no early stopping or ifvalidationfraction is None

Examples

decisionfunction selfX

Compute the decision function of X

Parameters

Xarraylike shape nsamples nfeatures The input samples

Returns

decision ndarray shape nsamples or nsamples ntreesperiteration The raw pre
dicted values ie the sum of the trees leaves for each sample ntreesperiteration is
equal to the number of classes in multiclass classification

fitselfXy

Fit the gradient boosting model

Parameters

Xarraylike shapensamples nfeatures The input samples
yarraylike shapensamples Target values

Returns

self object

getparams selfdeepTrue

Get parameters for this estimator

Parameters

deep boolean optional If True will return the parameters for this estimator and contained
subobjects that are estimators

Returns

params mapping of string to any Parameter names mapped to their values

predictselfX

Predict classes for X

Parameters

Xarraylike shape nsamples nfeatures The input samples

Returns

yndarray shape nsamples The predicted classes

predictproba selfX

Predict class probabilities for X

Parameters

Xarraylike shape nsamples nfeatures The input samples

Returns

pndarray shape nsamples nclasses The class probabilities of the input samples

612sklearnensemble Ensemble Methods 1729

scikitlearn user guide Release 0213

scoreselfXysampleweightNone

Returns the mean accuracy on the given test data and labels

In multilabel classification this is the subset accuracy which is a harsh metric since you require for each sample that each label set be correctly predicted

Parameters

Xarraylike shape nsamples nfeatures Test samples

yarraylike shape nsamples or nsamples noutputs True labels for X

sampleweight arraylike shape nsamples optional Sample weights

Returns

score float Mean accuracy of selfpredictX wrt y

setparams selfparams

Set the parameters of this estimator

The method works on simple estimators as well as on nested objects such as pipelines The latter have parameters of the form componentparameter so that it's possible to update each component of a nested object

Returns

self

613sklearnexceptions Exceptions and warnings

The sklearnexceptions module includes all custom warnings and error classes used across scikitlearn

exceptionsChangedBehaviorWarning Warning class used to notify the user of any change in the behavior

exceptionsConvergenceWarning Custom warning to capture convergence problems

exceptionsDataConversionWarning Warning used to notify implicit data conversions happening in the code

exceptionsDataDimensionalityWarning Custom warning to notify potential issues with data dimensionality

exceptionsEfficiencyWarning Warning used to notify the user of inefficient computation

exceptionsFitFailedWarning Warning class used if there is an error while fitting the estimator

exceptionsNotFittedError Exception class to raise if estimator is used before fitting

exceptionsNonBLASDotWarning Warning used when the dot operation does not use BLAS

exceptionsUndefinedMetricWarning Warning used when the metric is invalid

6131sklearnexceptions ChangedBehaviorWarning

class sklearnexceptions ChangedBehaviorWarning

Warning class used to notify the user of any change in the behavior

Changed in version 018 Moved from sklearnbase

- Compare Stochastic learning strategies for MLPClassifier
- Feature discretization

6133sklearnexceptions DataConversionWarning

classsklearnexceptions DataConversionWarning

Warning used to notify implicit data conversions happening in the code

This warning occurs when some input data needs to be converted or interpreted in a way that may not match the
user's expectations

For example this warning may occur when the user

- passes an integer array to a function which expects float input and will convert the input

613sklearnexceptions Exceptions and warnings 1731

scikitlearn user guide Release 0213

- requests a noncopying operation but a copy is required to meet the implementation's datatype expectations
- passes an input whose shape can be interpreted ambiguously

614sklearnexperimental Experimental

The sklearnexperimental module provides importable modules that enable the use of experimental features or estimators

The features and estimators that are experimental aren’t subject to deprecation cycles Use them at your own risks

experimentalenablehistgradientboosting Enables histogrambased gradient boosting estimators

experimentalenableiterativeimputer Enables IterativeImputer

6141 sklearnexperimentalenablehistgradientboosting

Enables histogrambased gradient boosting estimators

The API (Application Programming Interface) and results of these estimators might change without any deprecation cycle

Importing this file dynamically sets the sklearnensembleHistGradientBoostingClassifier and sklearnensembleHistGradientBoostingRegressor as attributes of the ensemble module

explicitly require this experimental feature

from sklearnexperimental import enablehistgradientboosting noqa

now you can import normally from ensemble

614sklearnexperimental Experimental 1735

scikitlearn user guide Release 0213

```
from sklearnensemble import HistGradientBoostingClassifier
from sklearnensemble import HistGradientBoostingRegressor
```

The noqa comment can be removed it just tells linters like flake8 to ignore the import which appears as unused

6142 sklearnexperimentalenableiterativeimputer

Enables IterativeImputer

The API (Application Programming Interface) and results of this estimator might change without any deprecation cycle

Importing this file dynamically sets sklearnimputeliterativeimputer as an attribute of the impute mod

ule

explicitly require this experimental feature

```
from sklearnexperimental import enableiterativeimputer noqa
```

now you can import normally from impute

```
from sklearnimpute import IterativeImputer
```

615sklearnfeatureextraction Feature Extraction

The sklearnfeatureextraction module deals with feature extraction from raw data It currently includes

methods to extract features from text and images

User guide See the Feature extraction section for further details

featureextractionDictVectorizer dtype

Transforms lists of featurevalue mappings to vectors

featureextractionFeatureHasher Implements feature hashing aka the hashing trick

6151sklearnfeatureextraction DictVectorizer

class sklearnfeatureextraction DictVectorizer dtypeclass 'numpyfloat64' separa

tor'' sparseTrue sortTrue

Transforms lists of featurevalue mappings to vectors

This transformer turns lists of mappings dictlike objects of feature names to feature values into Numpy arrays

or scipy sparse matrices for use with scikitlearn estimators

When feature values are strings this transformer will do a binary onehot aka oneofK coding one boolean

valued feature is constructed for each of the possible string values that the feature can take on For instance a

feature "f" that can take on the values "ham" and "spam" will become two features in the output one signifying

"fham" the other "fspam"

However note that this transformer will only do a binary onehot encoding when feature values are of type

string If categorical features are represented as numeric values such as int the DictVectorizer can be followed

by sklearnpreprocessingOneHotEncoder to complete binary onehot encoding

Features that do not occur in a sample mapping will have a zero value in the resulting arraymatrix

Read more in the User Guide

Parameters

1736 Chapter 6 API (Application Programming Interface) Reference

scikitlearn user guide Release 0213

dtype callable optional The type of feature values Passed to Numpy arrays
matrix constructors as the dtype argument

separator string optional Separator string used when constructing new features for onehot coding

sparse boolean optional Whether transform should produce scipysparse matrices True by default

sort boolean optional Whether featurenames and vocabulary should be sorted when fitting True by default

Attributes

vocabulary dict A dictionary mapping feature names to feature indices

featurenames list A list of length nfeatures containing the feature names eg “fham” and “fspam”

See also

FeatureHasher performs vectorization using only a hash function

sklearnpreprocessingOrdinalEncoder handles nominalcategorical features encoded as columns of arbitrary data types

Examples

```
from sklearnfeatureextraction import DictVectorizer
v = DictVectorizer(sparse=False)
D = {'foo': 1, 'bar': 2, 'foo': 3, 'baz': 1}
X = v.fit_transform(D)
X
array([[2, 0, 1],
       [0, 1, 3]])
v.inverse_transform(X)
array([[20, 10, 10, 10, 10]])
v.transform({'foo': 4, 'unseen': 3})
array([[0, 0, 4]])
```

Methods

fit(self, X, y) Learn a list of feature name - indices mappings

fit_transform(self, X, y) Learn a list of feature name - indices mappings and transform X

get_feature_names(self) Returns a list of feature names ordered by their indices

get_params(self, deep=True) Get parameters for this estimator

inverse_transform(self, X) dict type Transform array or sparse matrix X back to feature mappings

restrict(self, support_indices) Restrict the features to those in support using feature selection

set_params(self, params) Set the parameters of this estimator

Continued on next page

615sklearnfeatureextraction Feature Extraction 1737

transform self X Transform featurevalue dicts to array or sparse matrix

init selfdtypeclass ‘numpyfloat64’ separator’’ sparseTrue sortTrue
fitselfXyNone

Learn a list of feature name indices mappings

Parameters

XMapping or iterable over Mappings Dicts or Mappings from feature names arbitrary

Python objects to feature values strings or convertible to dtype

yignored

Returns

self

fittransform selfXyNone

Learn a list of feature name indices mappings and transform X

Like fitX followed by transformX but does not require materializing X in memory

Parameters

XMapping or iterable over Mappings Dicts or Mappings from feature names arbitrary

Python objects to feature values strings or convertible to dtype

yignored

Returns

Xarray sparse matrix Feature vectors always 2d

getfeaturenames self

Returns a list of feature names ordered by their indices

If oneofK coding is applied to categorical features this will include the constructed feature names but not the original ones

getparams selfdeepTrue

Get parameters for this estimator

Parameters

deep boolean optional If True will return the parameters for this estimator and contained

subobjects that are estimators

Returns

params mapping of string to any Parameter names mapped to their values

inversetransform selfXdictdtypeclass ‘dict’

Transform array or sparse matrix X back to feature mappings

X must have been produced by this DictVectorizer’s transform or fittransform method it may only have passed through transformers that preserve the number of features and their order

In the case of onehotoneofK coding the constructed feature names and values are returned rather than the original ones

Parameters

Xarraylike sparse matrix shape nsamples nfeatures Sample matrix

scikitlearn user guide Release 0213

dicttype callable optional Constructor for feature mappings Must conform to the col
lectionsMapping API (Application Programming Interface)

Returns

Dlist of dicttype objects length nsamples Feature mappings for the samples in X

restrict selfsupport indicesFalse

Restrict the features to those in support using feature selection

This function modifies the estimator inplace

Parameters

support arraylike Boolean mask or list of indices as returned by the getsupport member
of feature selectors

indices boolean optional Whether support is a list of indices

Returns

self

Examples

from sklearnfeatureextraction import DictVectorizer

from sklearnfeatureselection import SelectKBest chi2

v DictVectorizer

D foo 1 bar 2 foo 3 baz 1

X vfittransformD

support SelectKBestchi2 k2fitX 0 1

vgetfeaturenames

bar baz foo

vrestrictsupportgetsupport

DictVectorizerdtype separator sortTrue

sparseTrue

vgetfeaturenames

bar foo

setparams selfparams

Set the parameters of this estimator

The method works on simple estimators as well as on nested objects such as pipelines The latter have
parameters of the form componentparameter so that it's possible to update each component
of a nested object

Returns

self

transform selfX

Transform featurevalue dicts to array or sparse matrix

Named features not encountered during fit or fittransform will be silently ignored

Parameters

XMapping or iterable over Mappings length nsamples Dicts or Mappings from

feature names arbitrary Python objects to feature values strings or convertible to dtype

Returns

615sklearnfeatureextraction Feature Extraction 1739

scikitlearn user guide Release 0213

Xaarray sparse matrix Feature vectors always 2d

Examples using sklearnfeatureextractionDictVectorizer

•Column Transformer with Heterogeneous Data Sources

•FeatureHasher and DictVectorizer Comparison

6152sklearnfeatureextraction FeatureHasher

classsklearnfeatureextraction FeatureHasher nfeatures1048576 inputtype'dict'

dtypeclass 'numpyfloat64' alter

natesignTrue

Implements feature hashing aka the hashing trick

This class turns sequences of symbolic feature names strings into scipysparse matrices using a hash function to compute the matrix column corresponding to a name The hash function employed is the signed 32bit version of Murmurhash3

Feature names of type byte string are used asis Unicode strings are converted to UTF8 first but no Unicode normalization is done Feature values must be finite numbers

This class is a lowmemory alternative to DictVectorizer and CountVectorizer intended for largescale online learning and situations where memory is tight eg when running prediction code on embedded devices

Read more in the User Guide

Parameters

nfeatures integer optional The number of features columns in the output matrices Small numbers of features are likely to cause hash collisions but large numbers will cause larger coefficient dimensions in linear learners

inputtype string optional default "dict" Either "dict" the default to accept dictionaries over featurename value "pair" to accept pairs of featurename value or "string" to accept single strings featurename should be a string while value should be a number In the case of "string" a value of 1 is implied The featurename is hashed to find the appropriate column for the feature The value's sign might be flipped in the output but see nonnegative below

dtype numpy type optional default npfloat64 The type of feature values Passed to scipysparse matrix constructors as the dtype argument Do not set this to bool npboolean or any unsigned integer type

alternatesign boolean optional default True When True an alternating sign is added to the features as to approximately conserve the inner product in the hashed space even for small nfeatures This approach is similar to sparse random projection

See also

DictVectorizer vectorizes stringvalued features using a hash table

sklearnpreprocessingOneHotEncoder handles nominalcategorical features

1740 Chapter 6 API (Application Programming Interface) Reference

scikitlearn user guide Release 0213

Examples

from sklearnfeatureextraction import FeatureHasher

h = FeatureHasher(nfeatures=10

D = {'dog': 1, 'cat': 2, 'elephant': 4, 'dog': 2, 'run': 5

f = h.transform(D)

f.toarray()

array([[0, 0, 4, 1, 0, 0, 0, 0, 0, 2],

[0, 0, 0, 2, 5, 0, 0, 0, 0, 0]])

Methods

fit(self, X, y=None)

Fit to data then transform it

get_params(self, deep=True) Get parameters for this estimator

set_params(self, **kwargs) Set the parameters of this estimator

transform(self, X) Transform a sequence of instances to a scipy.sparse matrix

init(self, nfeatures=1048576, input_type='dict', dtypeclass='numpy.float64', alter

natesign=True)

fit(self, X=None, y=None)

Noop

This method doesn't do anything. It exists purely for compatibility with the scikitlearn transformer API (Application Programming Interface)

Parameters

Xarraylike

Returns

self: FeatureHasher

fit_transform(self, X=None, y=None) fit_params

Fit to data then transform it

Fits transformer to X and y with optional parameters fit_params and returns a transformed version of X

Parameters

X: numpy array of shape (n_samples, n_features) Training set

y: numpy array of shape (n_samples,) Target values

Returns

X_new: numpy array of shape (n_samples, n_features_new) Transformed array

get_params(self, deep=True)

Get parameters for this estimator

Parameters

deep: boolean optional. If True will return the parameters for this estimator and contained

subobjects that are estimators

Returns

615sklearnfeatureextraction Feature Extraction 1741

scikitlearn user guide Release 0213

params mapping of string to any Parameter names mapped to their values

setparams selfparams

Set the parameters of this estimator

The method works on simple estimators as well as on nested objects such as pipelines The latter have parameters of the form componentparameter so that it's possible to update each component

of a nested object

Returns

self

transform selfrawX

Transform a sequence of instances to a scipysparse matrix

Parameters

rawX iterable over raw features length nsamples Samples Each sample

must be iterable an eg a list or tuple containing generating feature names and option

ally values see the inputtype constructor argument which will be hashed rawX need

not support the len function so it can be the result of a generator nsamples is determined

on the fly

Returns

Xscipysparse matrix shape nsamples selfnfeatures Feature matrix for use with

estimators or further transformers

Examples using sklearnfeatureextractionFeatureHasher

•FeatureHasher and DictVectorizer Comparison

6153 From images

The sklearnfeatureextractionimage submodule gathers utilities to extract features from images

featureextractionimage

615sklearnfeatureextraction Feature Extraction 1745

scikitlearn user guide Release 0213

Examples

```
from sklearn.datasets import load_sample_images
from sklearn.feature_extraction import image
Use the array data from the second image in this dataset
X = load_sample_images(images1)
print Image.shape, format X.shape
Image shape 427 640 3
pe = image.PatchExtractor(patchsize=2, 2)
pe.fit X
petrans = petransform X
print Patches.shape, format petrans.shape
Patches shape 545706 2 2
```

Methods

```
fit self X y Do nothing and return the estimator unchanged
get_params self deep Get parameters for this estimator
set_params self params Set the parameters of this estimator
transform self X Transforms the image samples in X into a matrix of
patch data
init self patchsize=None maxpatches=None randomstate=None
fit self X y None
Do nothing and return the estimator unchanged
```

This method is just there to implement the usual API (Application Programming Interface) and hence work in pipelines

Parameters

```
X arraylike shape nsamples nfeatures Training data
get_params self deep True
Get parameters for this estimator
Parameters
deep boolean optional If True will return the parameters for this estimator and contained
subobjects that are estimators
```

Returns

```
params mapping of string to any Parameter names mapped to their values
set_params self params
Set the parameters of this estimator
The method works on simple estimators as well as on nested objects such as pipelines The latter have
parameters of the form component__parameter so that it's possible to update each component
of a nested object
Returns
self
transform self X
```

Transforms the image samples in X into a matrix of patch data
1746 Chapter 6 API (Application Programming Interface) Reference

dtypeclass 'numpyint64'

Convert a collection of text documents to a matrix of token counts

This implementation produces a sparse representation of the counts using scipysparsecsrmatrix

If you do not provide an apriori dictionary and you do not use an analyzer that does some kind of feature
selection then the number of features will be equal to the vocabulary size found by analyzing the data

Read more in the User Guide

Parameters

input string 'filename' 'file' 'content' If 'filename' the sequence passed as an argument to
fit is expected to be a list of filenames that need reading to fetch the raw content to analyze

615sklearnfeatureextraction Feature Extraction 1747

scikitlearn user guide Release 0213

If 'file' the sequence items must have a 'read' method filelike object that is called to fetch the bytes in memory

Otherwise the input is expected to be the sequence strings or bytes items are expected to be analyzed directly

encoding string 'utf8' by default If bytes or files are given to analyze this encoding is used to decode

decodeerror 'strict' 'ignore' 'replace' Instruction on what to do if a byte sequence is given to analyze that contains characters not of the given encoding By default it is 'strict' meaning that a UnicodeDecodeError will be raised Other values are 'ignore' and 'replace'

stripaccents 'ascii' 'unicode' None Remove accents and perform other character normalization during the preprocessing step 'ascii' is a fast method that only works on characters that have an direct ASCII mapping 'unicode' is a slightly slower method that works on any characters None default does nothing

Both 'ascii' and 'unicode' use NFKD normalization from unicodedatanormalize

lowercase boolean True by default Convert all characters to lowercase before tokenizing preprocessor callable or None default Override the preprocessing string transformation stage while preserving the tokenizing and ngrams generation steps

tokenizer callable or None default Override the string tokenization step while preserving the preprocessing and ngrams generation steps Only applies if analyzer 'word'

stopwords string 'english' list or None default If 'english' a builtin stop word list for English is used There are several known issues with 'english' and you should consider an alternative see Using stop words

If a list that list is assumed to contain stop words all of which will be removed from the resulting tokens Only applies if analyzer 'word'

If None no stop words will be used maxdf can be set to a value in the range 07 10

to automatically detect and filter stop words based on intra corpus document frequency of terms

tokenpattern string Regular expression denoting what constitutes a "token" only used if analyzer 'word' The default regexp select tokens of 2 or more alphanumeric

characters punctuation is completely ignored and always treated as a token separator

ngramrange tuple minn maxn The lower and upper boundary of the range of nvalues for different ngrams to be extracted All values of n such that minn ≤ n ≤ maxn will

be used

analyzer string 'word' 'char' 'charwb' or callable Whether the feature should be made of word or character ngrams Option 'charwb' creates character ngrams only from text inside word boundaries ngrams at the edges of words are padded with space

If a callable is passed it is used to extract the sequence of features out of the raw unprocessed input

Changed in version 021

Since v021 if input isfilename orfile the data is first read from the file and then passed to the given callable analyzer

maxdf float in range 00 10 or int default10 When building the vocabulary ignore terms that have a document frequency strictly higher than the given threshold corpusspecific stop

1748 Chapter 6 API (Application Programming Interface) Reference

scikitlearn user guide Release 0213

words If float the parameter represents a proportion of documents integer absolute counts

This parameter is ignored if vocabulary is not None

mindf float in range 00 10 or int default1 When building the vocabulary ignore terms

that have a document frequency strictly lower than the given threshold This value is also

called cutoff in the literature If float the parameter represents a proportion of documents

integer absolute counts This parameter is ignored if vocabulary is not None

maxfeatures int or None defaultNone If not None build a vocabulary that only consider

the top maxfeatures ordered by term frequency across the corpus

This parameter is ignored if vocabulary is not None

vocabulary Mapping or iterable optional Either a Mapping eg a dict where keys are terms

and values are indices in the feature matrix or an iterable over terms If not given a vocabu

lary is determined from the input documents Indices in the mapping should not be repeated

and should not have any gap between 0 and the largest index

binary boolean defaultFalse If True all non zero counts are set to 1 This is useful for

discrete probabilistic models that model binary events rather than integer counts

dtype type optional Type of the matrix returned by fittransform or transform

Attributes

vocabulary dict A mapping of terms to feature indices

stopwords set Terms that were ignored because they either

- occurred in too many documents maxdf

- occurred in too few documents mindf

- were cut off by feature selection maxfeatures

This is only available if no vocabulary was given

buildanalyzer self

Return a callable that handles preprocessing and tokenization

buildpreprocessor self

Return a function to preprocess the text before tokenization

buildtokenizer self

Return a function that splits a string into a sequence of tokens

decodeselfdoc

Decode the input into a string of unicode symbols

The decoding strategy depends on the vectorizer parameters

Parameters

doc string The string to decode

fitselfrawdocuments yNone

Learn a vocabulary dictionary of all tokens in the raw documents

Parameters

1750 Chapter 6 API (Application Programming Interface) Reference

scikitlearn user guide Release 0213

rawdocuments iterable An iterable which yields either str unicode or file objects

Returns

self

fittransform selfrawdocuments yNone

Learn the vocabulary dictionary and return termdocument matrix

This is equivalent to fit followed by transform but more efficiently implemented

Parameters

rawdocuments iterable An iterable which yields either str unicode or file objects

Returns

Xarray nsamples nfeatures Documentterm matrix

getfeaturenames self

Array mapping from feature integer indices to feature name

getparams selfdeepTrue

Get parameters for this estimator

Parameters

deep boolean optional If True will return the parameters for this estimator and contained

subobjects that are estimators

Returns

params mapping of string to any Parameter names mapped to their values

getstopwords self

Build or fetch the effective stop words list

inversetransform selfX

Return terms per document with nonzero entries in X

Parameters

Xarray sparse matrix shape nsamples nfeatures

Returns

Xinv list of arrays len nsamples List of arrays of terms

setparams selfparams

Set the parameters of this estimator

The method works on simple estimators as well as on nested objects such as pipelines The latter have

parameters of the form componentparameter so that it's possible to update each component

of a nested object

Returns

self

transform selfrawdocuments

Transform documents to documentterm matrix

Extract token counts out of raw text documents using the vocabulary fitted with fit or the one provided to

the constructor

Parameters

rawdocuments iterable An iterable which yields either str unicode or file objects

615sklearnfeatureextraction Feature Extraction 1751

scikitlearn user guide Release 0213

Returns

Xsparse matrix nsamples nfeatures Documentterm matrix

naryFalse norm'l2'

alternatesignTrue

dtypeclass

'numpyfloat64'

Convert a collection of text documents to a matrix of token occurrences

It turns a collection of text documents into a scipysparse matrix holding token occurrence counts or binary occurrence information possibly normalized as token frequencies if norm'l1' or projected on the euclidean unit sphere if norm'l2'

This text vectorizer implementation uses the hashing trick to find the token string name to feature integer index mapping

This strategy has several advantages

- it is very low memory scalable to large datasets as there is no need to store a vocabulary dictionary in memory
- it is fast to pickle and unpickle as it holds no state besides the constructor parameters
- it can be used in a streaming partial fit or parallel pipeline as there is no state computed during fit

There are also a couple of cons vs using a CountVectorizer with an inmemory vocabulary

- there is no way to compute the inverse transform from feature indices to string feature names which can be a problem when trying to introspect which features are most important to a model
- there can be collisions distinct tokens can be mapped to the same feature index However in practice this is rarely an issue if nfeatures is large enough eg 2^{18} for text classification problems
- no IDF weighting as this would render the transformer stateful

The hash function employed is the signed 32bit version of Murmurhash3

Examples using sklearnfeatureextractiontextHashingVectorizer

- Outofcore classification of text documents
- Clustering text documents using kmeans
- Classification of text documents using sparse features

sklearnfeatureextractiontext TfidfTransformer

classsklearnfeatureextractiontext TfidfTransformer norm'l2' useidfTrue

smoothidfTrue sublin

eartfFalse

Transform a count matrix to a normalized tf or tfidf representation

Tf means termfrequency while tfidf means termfrequency times inverse documentfrequency This is a common term weighting scheme in information retrieval that has also found good use in document classification The goal of using tfidf instead of the raw frequencies of occurrence of a token in a given document is to scale down the impact of tokens that occur very frequently in a given corpus and that are hence empirically less informative than features that occur in a small fraction of the training corpus

The formula that is used to compute the tfidf for a term t of a document d in a document set is $tfidf(d, t) = tf(d, t) \cdot idf(t)$ and the idf is computed as $idf(t) = \log \frac{n}{dft + 1}$ if smoothidfFalse where n is the total number of documents in the document set and dft is the document frequency of t the document frequency is the number of documents in the document set that contain the term t The effect of adding "1" to the idf in the equation above is that terms with zero idf ie terms that occur in all documents in a training set will not be entirely ignored Note that the idf formula above differs from the standard textbook notation that defines the idf as $idf(t) = \log \frac{n}{dft}$

IfsmoothidfTrue the default the constant "1" is added to the numerator and denominator of the idf as if an extra document was seen containing every term in the collection exactly once which prevents zero divisions $idf(d, t) = \log \frac{1 + n}{1 + dft}$

1756 Chapter 6 API (Application Programming Interface) Reference

scikitlearn user guide Release 0213

Furthermore the formulas used to compute tf and idf depend on parameter settings that correspond to the SMART notation used in IR as follows

Tf is “n” natural by default “l” logarithmic when sublineartfTrue Idf is “t” when useidf is given “n” none otherwise Normalization is “c” cosine when norml2 “n” none when normNone

Read more in the User Guide

Parameters

norm ‘l1’ ‘l2’ or None optional default ‘l2’ Each output row will have unit norm either ‘l2’ Sum of squares of vector elements is 1 The cosine similarity between two vectors is their dot product when l2 norm has been applied ‘l1’ Sum of absolute values of vector elements is 1 See preprocessingnormalize

useidf boolean defaultTrue Enable inversedocumentfrequency reweighting

smoothidf boolean defaultTrue Smooth idf weights by adding one to document frequencies as if an extra document was seen containing every term in the collection exactly once Prevents zero divisions

sublineartf boolean defaultFalse Apply sublinear tf scaling ie replace tf with 1 logtf

Attributes

idf array shape nfeatures The inverse document frequency IDF vector only defined if useidf is True

Return terms per document with nonzero entries in X

Parameters

Xarray sparse matrix shape nsamples nfeatures

Returns

Xinv list of arrays len nsamples List of arrays of terms

setparams selfparams

Set the parameters of this estimator

The method works on simple estimators as well as on nested objects such as pipelines The latter have

parameters of the form componentparameter so that it's possible to update each component

of a nested object

Returns

self

transform selfrawdocuments copyTrue

Transform documents to documentterm matrix

Uses the vocabulary and document frequencies df learned by fit or fittransform

Parameters

rawdocuments iterable an iterable which yields either str unicode or file objects

copy boolean default True Whether to copy X and operate on the copy or perform inplace

operations

Returns

Xsparse matrix nsamples nfeatures Tfidfweighted documentterm matrix

Examples using sklearnfeatureextractiontextTfidfVectorizer

•Topic extraction with Nonnegative Matrix Factorization and Latent Dirichlet Allocation

•Biclustering documents with the Spectral Coclustering algorithm

•Column Transformer with Heterogeneous Data Sources

•Clustering text documents using kmeans

615sklearnfeatureextraction Feature Extraction 1763

scikitlearn user guide Release 0213

•Classification of text documents using sparse features

616sklearnfeatureselection Feature Selection

The sklearnfeatureselection module implements feature selection algorithms It currently includes univariate filter selection methods and the recursive feature elimination algorithm

User guide See the Feature selection section for further details

featureselection

GenericUnivariateSelect Univariate feature selector with configurable strategy

featureselectionSelectPercentile Select features according to a percentile of the highest scores

featureselectionSelectKBest scorefunc

kSelect features according to the k highest scores

featureselectionSelectFpr scorefunc al

phaFilter Select the pvalues below alpha based on a FPR test

featureselectionSelectFdr scorefunc al

phaFilter Select the pvalues for an estimated false discovery rate

featureselection

SelectFromModel estimatorMetatransformer for selecting features based on importance weights

featureselectionSelectFwe scorefunc al

phaFilter Select the pvalues corresponding to Familywise error rate

featureselectionRFE estimator Feature ranking with recursive feature elimination

featureselectionRFECV estimator step Feature ranking with recursive feature elimination and crossvalidated selection of the best number of features

featureselection

VarianceThreshold thresholdFeature selector that removes all lowvariance features

6161sklearnfeatureselection GenericUnivariateSelect

class sklearnfeatureselection GenericUnivariateSelect scorefuncfunction

fclassif mode'percentile'

param1e05

Univariate feature selector with configurable strategy

Read more in the User Guide

Parameters

scorefunc callable Function taking two arrays X and y and returning a pair of arrays scores

pvalues For modes 'percentile' or 'kbest' it can return a single array scores

mode 'percentile' 'kbest' 'fpr' 'fdr' 'fwe' Feature selection mode

param float or int depending on the feature selection mode Parameter of the corresponding mode

Attributes

scores arraylike shapenfeatures Scores of features

pvalues arraylike shapenfeatures pvalues of feature scores None if scorefunc

returned scores only

inversetransform self X Reverse the transformation operation

setparams self params Set the parameters of this estimator

transform self X Reduce X to the selected features

init selfscorefuncfunction fclassif at 0x7efe30bb2158 mode'percentile' param1e05

fitselfXy

Run score function on X y and get the appropriate features

Parameters

Xarraylike shape nsamples nfeatures The training input samples

yarraylike shape nsamples The target values class labels in classification real numbers in regression

Returns

616sklearn.feature_selection Feature Selection 1765

scikitlearn user guide Release 0213

self object
fittransform selfXyNone fitparams
Fit to data then transform it
Fits transformer to X and y with optional parameters fitparams and returns a transformed version of X
Parameters
Xnumpy array of shape nsamples nfeatures Training set
ynumpy array of shape nsamples Target values
Returns
Xnew numpy array of shape nsamples nfeaturesnew Transformed array
getparams selfdeepTrue
Get parameters for this estimator
Parameters
deep boolean optional If True will return the parameters for this estimator and contained
subobjects that are estimators
Returns
params mapping of string to any Parameter names mapped to their values
getsupport selfindicesFalse
Get a mask or integer index of the features selected
Parameters
indices boolean default False If True the return value will be an array of integers rather
than a boolean mask
Returns
support array An index that selects the retained features from a feature vector If
indices is False this is a boolean array of shape input features in which an ele
ment is True iff its corresponding feature is selected for retention If indices is True
this is an integer array of shape output features whose values are indices into the input
feature vector
inversetransform selfX
Reverse the transformation operation
Parameters
Xarray of shape nsamples nselectedfeatures The input samples
Returns
Xr array of shape nsamples noriginalfeatures Xwith columns of zeros inserted
where features would have been removed by transform
setparams selfparams
Set the parameters of this estimator
The method works on simple estimators as well as on nested objects such as pipelines The latter have
parameters of the form componentparameter so that it's possible to update each component
of a nested object
Returns
self

scikitlearn user guide Release 0213

transform selfX

Reduce X to the selected features

Parameters

Xarray of shape nsamples nfeatures The input samples

Returns

Xr array of shape nsamples nselectedfeatures The input samples with only the selected features

6162sklearnfeatureselection SelectPercentile

classssklearnfeatureselection SelectPercentile scorefuncfunction fclassif percentile10

Select features according to a percentile of the highest scores

Read more in the User Guide

Parameters

scorefunc callable Function taking two arrays X and y and returning a pair of arrays scores pvalues or a single array with scores Default is fclassif see below “See also” The default function only works with classification tasks

percentile int optional default10 Percent of features to keep

Attributes

scores arraylike shapenfeatures Scores of features

pvalues arraylike shapenfeatures pvalues of feature scores None if scorefunc returned only scores

Methods

fitself X y Run score function on X y and get the appropriate

features

fit_transform self X y Fit to data then transform it

get_params self deep Get parameters for this estimator

get_support self indices Get a mask or integer index of the features selected

inverse_transform self X Reverse the transformation operation

set_params self params Set the parameters of this estimator

transform self X Reduce X to the selected features

init self score_func function fclassif at 0x7f3c10e93840 percentile=10

fitself X y

Run score function on X y and get the appropriate features

Parameters

Xarraylike shape nsamples nfeatures The training input samples

yarraylike shape nsamples The target values class labels in classification real num

bers in regression

Returns

self object

fit_transform self X y None fit_params

Fit to data then transform it

Fits transformer to X and y with optional parameters fit_params and returns a transformed version of X

Parameters

Xnumpy array of shape nsamples nfeatures Training set

ynumpy array of shape nsamples Target values

Returns

Xnew numpy array of shape nsamples nfeaturesnew Transformed array

get_params self deep True

Get parameters for this estimator

Parameters

1768 Chapter 6 API (Application Programming Interface) Reference

scikitlearn user guide Release 0213

deep boolean optional If True will return the parameters for this estimator and contained subobjects that are estimators

Returns

params mapping of string to any Parameter names mapped to their values

getsupport selfindicesFalse

Get a mask or integer index of the features selected

Parameters

indices boolean default False If True the return value will be an array of integers rather than a boolean mask

Returns

support array An index that selects the retained features from a feature vector If

indices is False this is a boolean array of shape input features in which an ele

ment is True iff its corresponding feature is selected for retention If indices is True

this is an integer array of shape output features whose values are indices into the input feature vector

inversetransform selfX

Reverse the transformation operation

Parameters

Xarray of shape nsamples nselectedfeatures The input samples

Returns

Xr array of shape nsamples noriginalfeatures Xwith columns of zeros inserted

where features would have been removed by transform

setparams selfparams

Set the parameters of this estimator

The method works on simple estimators as well as on nested objects such as pipelines The latter have

parameters of the form componentparameter so that it's possible to update each component

of a nested object

Returns

self

transform selfX

Reduce X to the selected features

Parameters

Xarray of shape nsamples nfeatures The input samples

Returns

Xr array of shape nsamples nselectedfeatures The input samples with only the selected features

Examples using sklearnfeatureselectionSelectPercentile

•Feature agglomeration vs univariate selection

•Univariate Feature Selection

•SVMAnova SVM (Support Vector Machine) with univariate feature selection

616sklearnfeatureselection Feature Selection 1769

scikitlearn user guide Release 0213

6163sklearnfeatureselection SelectKBest

classsklearnfeatureselection SelectKBest scorefuncfunction fclassif k10

Select features according to the k highest scores

self

transform selfX

Reduce X to the selected features

Parameters

Xarray of shape nsamples nfeatures The input samples

Returns

616sklearnfeatureselection Feature Selection 1777

scikitlearn user guide Release 0213

Xr array of shape nsamples nselectedfeatures The input samples with only the selected features

6166sklearnfeatureselection SelectFromModel

classsklearnfeatureselection SelectFromModel estimator thresholdNone prefitFalse normorder1 maxfeaturesNone

Metatransformer for selecting features based on importance weights

New in version 017

Parameters

estimator object The base estimator from which the transformer is built This can be both a fitted ifprefit is set to True or a nonfitted estimator The estimator must have either a featureimportances orcoef attribute after fitting

threshold string float optional default None The threshold value to use for feature selection

Features whose importance is greater or equal are kept while the others are discarded If

“median” resp “mean” then the threshold value is the median resp the mean of the

feature importances A scaling factor eg “125mean” may also be used If None and

if the estimator has a parameter penalty set to l1 either explicitly or implicitly eg Lasso

the threshold used is 1e5 Otherwise “mean” is used by default

prefit bool default False Whether a prefit model is expected to be passed into the constructor directly or not If True transform must be called directly and SelectFromModel can

not be used with crossvalscore GridSearchCV and similar utilities that clone

the estimator Otherwise train the model using fit and thentransform to do feature

selection

normorder nonzero int inf inf default 1 Order of the norm used to filter the vectors of coefficients below threshold in the case where the coef attribute of the estimator is of dimension 2

maxfeatures int or None optional The maximum number of features selected scoring above threshold To disable threshold and only select based on maxfeatures set

thresholdnpinf

New in version 020

Attributes

estimator an estimator The base estimator from which the transformer is built This is stored only when a nonfitted estimator is passed to the SelectFromModel ie when prefit is

False

threshold float The threshold value used for feature selection

Methods

fitself X y Fit the SelectFromModel metatransformer

fittransform self X y Fit to data then transform it

getparams self deep Get parameters for this estimator

getsupport self indices Get a mask or integer index of the features selected

inversetransform self X Reverse the transformation operation

partialfit self X y Fit the SelectFromModel metatransformer only once

Continued on next page

1778 Chapter 6 API (Application Programming Interface) Reference

setparams self params Set the parameters of this estimator

transform self X Reduce X to the selected features

init selfestimator thresholdNone prefitFalse normorder1 maxfeaturesNone

fitselfXyNone fitparams

Fit the SelectFromModel metatransformer

Parameters

Xarraylike of shape nsamples nfeatures The training input samples

yarraylike shape nsamples The target values integers that correspond to classes in classification real numbers in regression

fitparams Other estimator specific parameters

Returns

self object

fittransform selfXyNone fitparams

Fit to data then transform it

Fits transformer to X and y with optional parameters fitparams and returns a transformed version of X

Parameters

Xnumpy array of shape nsamples nfeatures Training set

ynumpy array of shape nsamples Target values

Returns

Xnew numpy array of shape nsamples nfeaturesnew Transformed array

getparams selfdeepTrue

Get parameters for this estimator

Parameters

deep boolean optional If True will return the parameters for this estimator and contained subobjects that are estimators

Returns

params mapping of string to any Parameter names mapped to their values

getsupport selfindicesFalse

Get a mask or integer index of the features selected

Parameters

indices boolean default False If True the return value will be an array of integers rather than a boolean mask

Returns

support array An index that selects the retained features from a feature vector If

indices is False this is a boolean array of shape input features in which an ele

ment is True iff its corresponding feature is selected for retention If indices is True

this is an integer array of shape output features whose values are indices into the input

feature vector

scikitlearn user guide Release 0213

inversetransform selfX

Reverse the transformation operation

Parameters

Xarray of shape nsamples nselectedfeatures The input samples

Returns

Xr array of shape nsamples noriginalfeatures Xwith columns of zeros inserted

where features would have been removed by transform

partialfit selfXyNone fitparams

Fit the SelectFromModel metatransformer only once

Parameters

Xarraylike of shape nsamples nfeatures The training input samples

yarraylike shape nsamples The target values integers that correspond to classes in

classification real numbers in regression

fitparams Other estimator specific parameters

Returns

self object

setparams selfparams

Set the parameters of this estimator

The method works on simple estimators as well as on nested objects such as pipelines The latter have

parameters of the form componentparameter so that it's possible to update each component

of a nested object

Returns

self

transform selfX

Reduce X to the selected features

Parameters

Xarray of shape nsamples nfeatures The input samples

Returns

Xr array of shape nsamples nselectedfeatures The input samples with only the se

lected features

Examples using sklearnfeatureselectionSelectFromModel

•Feature selection using SelectFromModel and LassoCV

•Classification of text documents using sparse features

Get a mask or integer index of the features selected

Parameters

indices boolean default False If True the return value will be an array of integers rather than a boolean mask

Returns

support array An index that selects the retained features from a feature vector If

indices is False this is a boolean array of shape input features in which an element

is True iff its corresponding feature is selected for retention If indices is True

this is an integer array of shape output features whose values are indices into the input feature vector

inversetransform selfX

Reverse the transformation operation

Parameters

Xarray of shape nsamples nselectedfeatures The input samples

Returns

Xr array of shape nsamples noriginalfeatures Xwith columns of zeros inserted

where features would have been removed by transform

1782 Chapter 6 API (Application Programming Interface) Reference

scikitlearn user guide Release 0213

setparams selfparams

Set the parameters of this estimator

The method works on simple estimators as well as on nested objects such as pipelines The latter have parameters of the form componentparameter so that it's possible to update each component of a nested object

Returns

self

transform selfX

Reduce X to the selected features

Parameters

Xarray of shape nsamples nfeatures The input samples

Returns

Xr array of shape nsamples nselectedfeatures The input samples with only the selected features

6168sklearnfeatureselection RFE

classsklearnfeatureselection RFEestimator nfeaturestoselectNone step1 verbose0

Feature ranking with recursive feature elimination

Given an external estimator that assigns weights to features eg the coefficients of a linear model the goal of recursive feature elimination RFE is to select features by recursively considering smaller and smaller sets of features First the estimator is trained on the initial set of features and the importance of each feature is obtained either through a coef attribute or through a featureimportances attribute Then the least important features are pruned from current set of features That procedure is recursively repeated on the pruned set until the desired number of features to select is eventually reached

Read more in the User Guide

Parameters

estimator object A supervised learning estimator with a fit method that provides information about feature importance either through a coef attribute or through a featureimportances attribute

nfeaturestoselect int or None defaultNone The number of features to select If None half of the features are selected

step int or float optional default1 If greater than or equal to 1 then step corresponds to the integer number of features to remove at each iteration If within 00 10 then step corresponds to the percentage rounded down of features to remove at each iteration

verbose int default0 Controls verbosity of output

Attributes

nfeatures int The number of selected features

support array of shape nfeatures The mask of selected features

ranking array of shape nfeatures The feature ranking such that rankingi corresponds to the ranking position of the ith feature Selected ie estimated best features are assigned rank 1

estimator object The external estimator fit on the reduced dataset

Examples

The following example shows how to retrieve the 5 right informative features in the Friedman 1 dataset

```
from sklearn.datasets import makefriedman1
```

```
from sklearn.feature_selection import RFE
```

```
from sklearn.svm import SVR (Support Vector Regression)
```

```
X, y = makefriedman1(n_samples=50, n_features=10, random_state=0)
```

```
estimator = SVR(kernel='linear')
```

```
selector = RFE(estimator, 5, step=1)
```

```
selector.fit(X, y)
```

```
selector.support
```

```
array([ True,  True,  True,  True,  True, False, False, False, False,
```

```
       False])
```

```
selector.ranking
```

```
array([1, 1, 1, 1, 1, 6, 4, 3, 2, 5])
```

Parameters

estimator object A supervised learning estimator with a fit method that provides information about feature importance either through a coef attribute or through a featureimportances attribute

step int or float optional default1 If greater than or equal to 1 then step corresponds to the integer number of features to remove at each iteration If within 00 10 then step corresponds to the percentage rounded down of features to remove at each iteration Note that the last iteration may remove fewer than step features in order to reach minfeaturestoselect

minfeaturestoselect int default1 The minimum number of features to be selected

This number of features will always be scored even if the difference between the original feature count and minfeaturestoselect isn't divisible by step

cvint crossvalidation generator or an iterable optional Determines the crossvalidation splitting strategy Possible inputs for cv are

• None to use the default 3fold crossvalidation

• integer to specify the number of folds

•CV (Cross-Validation) splitter

• An iterable yielding train test splits as arrays of indices

For integerNone inputs if yis binary or multiclass sklearnmodelselection

StratifiedKFold is used If the estimator is a classifier or if yis neither binary nor

multiclass sklearnmodelselectionKFold is used

Refer User Guide for the various crossvalidation strategies that can be used here

Changed in version 020 cvdefault value of None will change from 3fold to 5fold in v022

61614 sklearn.feature_selection.mutual_info_classif

sklearn.feature_selection.mutual_info_classif X y discrete features 'auto'

n_neighbors=3 copy=True random_state=None

domstate=None

Estimate mutual information for a discrete target variable

Mutual information MI between two random variables is a nonnegative value which measures the dependency between the variables. It is equal to zero if and only if two random variables are independent and higher values mean higher dependency.

The function relies on nonparametric methods based on entropy estimation from k-nearest neighbors distances as described in [2] and [3]. Both methods are based on the idea originally proposed in [4]. It can be used for univariate features selection. Read more in the User Guide.

Parameters

X: array-like or sparse matrix shape (n_samples, n_features) Feature matrix

y: array-like shape (n_samples) Target vector

discrete_features: 'auto' bool array-like default 'auto' If bool then determines whether to consider all features discrete or continuous. If array then it should be either a boolean mask with shape (n_features) or array with indices of discrete features. If 'auto' it is assigned to False for dense X and to True for sparse X.

n_neighbors: int default 3 Number of neighbors to use for MI estimation for continuous variables. See [2] and [3]. Higher values reduce variance of the estimation but could introduce a bias.

copy: bool default True Whether to make a copy of the given data. If set to False the initial data will be overwritten.

random_state: int RandomState instance or None optional default None The seed of the pseudo random number generator for adding small noise to continuous variables in order to remove repeated values. If int random_state is the seed used by the random number generator.

1796 Chapter 6 API (Application Programming Interface) Reference

scikitlearn user guide Release 0213

generator If RandomState instance randomstate is the random number generator If None the random number generator is the RandomState instance used by nprandom

Returns

mindarray shape nfeatures Estimated mutual information between each feature and the target

Notes

1 The term “discrete features” is used instead of naming them “categorical” because it describes the essence more accurately For example pixel intensities of an image are discrete features but hardly categorical and you will get better results if mark them as such Also note that treating a continuous variable as discrete and vice versa will usually give incorrect results so be attentive about that

2 True mutual information can’t be negative If its estimate turns out to be negative it is replaced by zero

Gaussian process classification GPC based on Laplace approximation

The implementation is based on Algorithm 31 32 and 51 of Gaussian Processes for Machine Learning

GPML by Rasmussen and Williams

1798 Chapter 6 API (Application Programming Interface) Reference

scikitlearn user guide Release 0213

Internally the Laplace approximation is used for approximating the nonGaussian posterior by a Gaussian. Currently the implementation is restricted to using the logistic link function. For multiclass classification several binary oneversus rest classifiers are fitted. Note that this class thus does not implement a true multi-class Laplace approximation.

Parameters

kernel kernel object The kernel specifying the covariance function of the GP. If None is passed the kernel “10 RBF10” is used as default. Note that the kernel’s hyperparameters are optimized during fitting.

optimizer string or callable optional default “fminlbfgsb” Can either be one of the internally supported optimizers for optimizing the kernel’s parameters specified by a string or an externally defined optimizer passed as a callable. If a callable is passed it must have the signature

defoptimizerobjfunc initialtheta bounds

objfunc is the objective function to be maximized which takes the hyperparameters theta as parameter and an optional flag evalgradient which determines if the gradient is returned additionally to the function value.

initialtheta the initial value for theta which can be used by local optimizers.

bounds the bounds on the values of theta.

Returned are the best found hyperparameters theta and the corresponding value of the target function.

returnthetaopt funcmin

Per default the ‘fminlbfgsb’ algorithm from scipy.optimize is used. If None is passed the kernel’s parameters are kept fixed. Available internal optimizers are

fminlbfgsb

nrestartsoptimizer int optional default 0 The number of restarts of the optimizer for finding the kernel’s parameters which maximize the logmarginal likelihood. The first run of the optimizer is performed from the kernel’s initial parameters, the remaining ones if any from thetas sampled loguniform randomly from the space of allowed thetavalues. If greater than 0 all bounds must be finite. Note that nrestartsoptimizer0 implies that one run is performed.

maxiterpredict int optional default 100 The maximum number of iterations in Newton’s method for approximating the posterior during predict. Smaller values will reduce computation time at the cost of worse results.

warmstart bool optional default False If warmstarts are enabled the solution of the last Newton iteration on the Laplace approximation of the posterior mode is used as initialization for the next call of posteriormode. This can speed up convergence when posteriormode is called several times on similar problems as in hyperparameter optimization. See the Glossary.

copyXtrain bool optional default True If True a persistent copy of the training data is stored in the object. Otherwise just a reference to the training data is stored which might cause predictions to change if the data is modified externally.

randomstate int RandomState instance or None optional default None The generator used to initialize the centers. If int randomstate is the seed used by the random number generator.

scikitlearn user guide Release 0213

generator If RandomState instance randomstate is the random number generator If None the random number generator is the RandomState instance used by nprandom
multiclass string default Specifies how multiclass classification problems are handled
Supported are “onevsrest” and “onevsone” In “onevsrest” one binary Gaussian process classifier is fitted for each class which is trained to separate this class from the rest
In “onevsone” one binary Gaussian process classifier is fitted for each pair of classes which is trained to separate these two classes The predictions of these binary predictors are combined into multiclass predictions Note that “onevsone” does not support predicting probability estimates

njobs int or None optional defaultNone The number of jobs to use for the computation
None means 1 unless in a joblibparallelbackend context1means using all processors See Glossary for more details

Attributes
kernel kernel object The kernel used for prediction In case of binary classification the structure of the kernel is the same as the one passed as parameter but with optimized hy perparameters In case of multiclass classification a CompoundKernel is returned which consists of the different kernels used in the oneversusrest classifiers
logmarginallikelihoodvalue float The logmarginallikelihood of selfkernel
theta

classes arraylike shape nclasses Unique class labels
nclasses int The number of classes in the training data

Examples

Methods
fitself X y Fit Gaussian process classification model
getparams self deep Get parameters for this estimator
logmarginallikelihood self theta Returns logmarginal likelihood of theta for training data
predict self X Perform classification on an array of test vectors X
predictproba self X Return probability estimates for the test vector X

Continued on next page

1800 Chapter 6 API (Application Programming Interface) Reference

score self X y sampleweight Returns the mean accuracy on the given test data and labels

setparams self params Set the parameters of this estimator

init self kernelNone optimizer'fminlbfgsb' nrestartsoptimizer0

maxiterpredict100 warmstartFalse copyXtrainTrue randomstateNone

multiclass'onevsrest' njobsNone

fitselfXy

Fit Gaussian process classification model

Parameters

Xarraylike shape nsamples nfeatures Training data

yarraylike shape nsamples Target values must be binary

Returns

self returns an instance of self

getparams selfdeepTrue

Get parameters for this estimator

Parameters

deep boolean optional If True will return the parameters for this estimator and contained

subobjects that are estimators

Returns

params mapping of string to any Parameter names mapped to their values

logmarginallikelihood selfthetaNone evalgradientFalse

Returns logmarginal likelihood of theta for training data

In the case of multiclass classification the mean logmarginal likelihood of the oneversusrest classifiers are returned

Parameters

theta arraylike shape nkernelparams or none Kernel hyperparameters for which the logmarginal likelihood is evaluated In the case of multiclass classification theta may be the hyperparameters of the compound kernel or of an individual kernel In the latter case all individual kernel get assigned the same theta values If None the precomputed logmarginallikelihood of selfkerneltheta is returned

evalgradient bool default False If True the gradient of the logmarginal likelihood with respect to the kernel hyperparameters at position theta is returned additionally Note that gradient computation is not supported for nonbinary classification If True theta must not be None

Returns

loglikelihood float Logmarginal likelihood of theta for training data

loglikelihoodgradient array shape nkernelparams optional Gradient of the log marginal likelihood with respect to the kernel hyperparameters at position theta Only returned when evalgradient is True

predictselfX

Perform classification on an array of test vectors X

scikitlearn user guide Release 0213

Parameters

Xarraylike shape nsamples nfeatures

Returns

Carray shape nsamples Predicted target values for X values are from classes

predictproba selfX

Return probability estimates for the test vector X

Parameters

Xarraylike shape nsamples nfeatures

Returns

Carraylike shape nsamples nclasses Returns the probability of the samples for each class in the model The columns correspond to the classes in sorted order as they appear in the attribute classes

scoreselfXysampleweightNone

Returns the mean accuracy on the given test data and labels

In multilabel classification this is the subset accuracy which is a harsh metric since you require for each sample that each label set be correctly predicted

Parameters

Xarraylike shape nsamples nfeatures Test samples

yarraylike shape nsamples or nsamples noutputs True labels for X

sampleweight arraylike shape nsamples optional Sample weights

Returns

score float Mean accuracy of selfpredictX wrt y

setparams selfparams

Set the parameters of this estimator

The method works on simple estimators as well as on nested objects such as pipelines The latter have parameters of the form componentparameter so that it's possible to update each component of a nested object

Returns

self

Examples using sklearngaussianprocessGaussianProcessClassifier

- Plot classification probability
 - Classifier comparison
 - Illustration of Gaussian process classification GPC on the XOR dataset
 - Gaussian process classification GPC on iris dataset
 - Isoprobability lines for Gaussian Processes classification GPC

```

Gaussian process regression GPR

The implementation is based on Algorithm 21 of Gaussian Processes for Machine Learning GPML by Ras
mussen and Williams

In addition to standard scikitlearn estimator API (Application Programming Interface) GaussianProcessRegressor

- allows prediction without prior fitting based on the GP prior
- provides an additional method sampleX which evaluates samples drawn from the GPR prior or pos
terior at given inputs
- exposes a method logmarginallikelihoodtheta which can be used externally for other ways of selecting
hyperparameters eg via Markov chain Monte Carlo

Read more in the User Guide

New in version 018

Parameters

kernel kernel object The kernel specifying the covariance function of the GP If None is
passed the kernel “10 RBF10” is used as default Note that the kernel’s hyperpa
rameters are optimized during fitting
alpha float or arraylike optional default 1e10 Value added to the diagonal of the kernel
matrix during fitting Larger values correspond to increased noise level in the observations
This can also prevent a potential numerical issue during fitting by ensuring that the calcu
lated values form a positive definite matrix If an array is passed it must have the same
number of entries as the data used for fitting and is used as datapointdependent noise level
Note that this is equivalent to adding a WhiteKernel with calpha Allowing to specify the
noise level directly as a parameter is mainly for convenience and for consistency with Ridge
optimizer string or callable optional default “fminlbfgsb” Can either be one of the
internally supported optimizers for optimizing the kernel’s parameters specified by a string
or an externally defined optimizer passed as a callable If a callable is passed it must have
the signature

```
defoptimizerobjfunc initialtheta bounds
objfunc is the objective function to be minimized which
takes the hyperparameters theta as parameter and an
optional flag evalgradient which determines if the
gradient is returned additionally to the function value
initialtheta the initial value for theta which can be
used by local optimizers
bounds the bounds on the values of theta
```

Returned are the best found hyperparameters theta and
the corresponding value of the target function

returnthetaopt funcmin

Per default the ‘fminlbfgsb’ algorithm from scipyoptimize is used If None is passed
the kernel’s parameters are kept fixed Available internal optimizers are

617sklearnprocess Gaussian Processes 1803

fminlbfgsb

nrestartsoptimizer int optional default 0 The number of restarts of the optimizer for finding the kernel’s parameters which maximize the logmarginal likelihood The first run of the optimizer is performed from the kernel’s initial parameters the remaining ones if any from thetas sampled loguniform randomly from the space of allowed thetavalues If greater than 0 all bounds must be finite Note that nrestartsoptimizer 0 implies that one run is performed

normalizey boolean optional default False Whether the target values y are normalized ie the mean of the observed target values become zero This parameter should be set to True if the target values’ mean is expected to differ considerable from zero When enabled the normalization effectively modifies the GP’s prior based on the data which contradicts the likelihood principle normalization is thus disabled per default

copyXtrain bool optional default True If True a persistent copy of the training data is stored in the object Otherwise just a reference to the training data is stored which might cause predictions to change if the data is modified externally

randomstate int RandomState instance or None optional default None The generator used to initialize the centers If int randomstate is the seed used by the random number generator If RandomState instance randomstate is the random number generator If None the random number generator is the RandomState instance used by nprandom

Attributes

Xtrain arraylike shape nsamples nfeatures Feature values in training data also required for prediction

ytrain arraylike shape nsamples noutputdims Target values in training data also required for prediction

kernel kernel object The kernel used for prediction The structure of the kernel is the same as the one passed as parameter but with optimized hyperparameters

Larraylike shape nsamples nsamples Lowertriangular Cholesky decomposition of the kernel in Xtrain

alpha arraylike shape nsamples Dual coefficients of training data points in kernel space

logmarginallikelihoodvalue float The logmarginallikelihood of selfkernel

theta

617sklearn Gaussian Processes 1805

scikitlearn user guide Release 0213

predictselfXreturnstdFalse returncovFalse

Predict using the Gaussian process regression model

We can also predict based on an unfitted model by using the GP prior In addition to the mean of the predictive distribution also its standard deviation returnstdTrue or covariance returncovTrue Note that at most one of the two can be requested

Parameters

Xarraylike shape nsamples nfeatures Query points where the GP is evaluated

returnstd bool default False If True the standard deviation of the predictive distribution at the query points is returned along with the mean

returncov bool default False If True the covariance of the joint predictive distribution at the query points is returned along with the mean

Returns

ymean array shape nsamples noutputdims Mean of predictive distribution at query points

ystd array shape nsamples optional Standard deviation of predictive distribution at query points Only returned when returnstd is True

ycov array shape nsamples nsamples optional Covariance of joint predictive distribution at query points Only returned when returncov is True

sample selfXnsamples1 randomstate0

Draw samples from Gaussian process and evaluate at X

Parameters

Xarraylike shape nsamplesX nfeatures Query points where the GP samples are evaluated

nsamples int default 1 The number of samples drawn from the Gaussian process

randomstate int RandomState instance or None optional default0 If int randomstate is the seed used by the random number generator If RandomState instance

randomstate is the random number generator If None the random number generator is the RandomState instance used by nprandom

Returns

ysamples array shape nsamplesX noutputdims nsamples Values of

nsamples samples drawn from Gaussian process and evaluated at query points

scoreselfXysampleweightNone

Returns the coefficient of determination R2 of the prediction

The coefficient R2 is defined as $1 - \frac{u}{v}$ where u is the residual sum of squares $y_{true} - y_{pred}$

$2sum$ and v is the total sum of squares $y_{true} - y_{truemean}$ $2sum$ The best possible score

is 10 and it can be negative because the model can be arbitrarily worse A constant model that always predicts the expected value of y disregarding the input features would get a R2 score of 00

Parameters

Xarraylike shape nsamples nfeatures Test samples For some estimators this may

be a precomputed kernel matrix instead shape nsamples nsamplesfitted where

nsamplesfitted is the number of samples used in the fitting for the estimator

yarraylike shape nsamples or nsamples noutputs True values for X

sampleweight arraylike shape nsamples optional Sample weights

1806 Chapter 6 API (Application Programming Interface) Reference

scikitlearn user guide Release 0213

Returns

score float R2 of selfpredictX wrt y

Notes

The R2 score used when calling score on a regressor will use multioutputuniformaverage

from version 023 to keep consistent with metricsr2score This will influence the score

method of all the multioutput regressors except for multioutputMultiOutputRegressor

To specify the default value manually and avoid the warning please either call metricsr2score

directly or make a custom scorer with metricsmakescorer the builtin scorer r2 uses

multioutputuniformaverage

setparams selfparams

Set the parameters of this estimator

The method works on simple estimators as well as on nested objects such as pipelines The latter have

parameters of the form componentparameter so that it's possible to update each component

of a nested object

Returns

self

Examples using sklearngaussianprocessGaussianProcessRegressor

- Comparison of kernel ridge and Gaussian process regression

- Illustration of prior and posterior Gaussian process for different kernels

- Gaussian process regression GPR with noiselevel estimation

- Gaussian Processes regression basic introductory example

6173sklearn gaussianprocesskernels CompoundKernel

class sklearn gaussianprocesskernels CompoundKernel kernels

Kernel which is composed of a set of other kernels

New in version 018

Parameters

kernels list of Kernel objects The other kernels

Attributes

bounds Returns the logtransformed bounds on the theta

hyperparameters Returns a list of all hyperparameter specifications

ndims Returns the number of nonfixed hyperparameters of the kernel

theta Returns the flattened logtransformed nonfixed hyperparameters

Methods

call self X Y evalgradient Return the kernel kX Y and optionally its gradient

clonewiththeta self theta Returns a clone of self with given hyperparameters

theta

diag self X Returns the diagonal of the kernel kX X

getparams self deep Get parameters of this kernel

isstationary self Returns whether the kernel is stationary

setparams self params Set the parameters of this kernel

init selfkernels

call selfXYNone evalgradientFalse

Return the kernel kX Y and optionally its gradient

Note that this compound kernel returns the results of all simple kernel stacked along an additional axis

Parameters

Xarray shape nsamplesX nfeatures Left argument of the returned kernel kX Y

Yarray shape nsamplesY nfeatures optional defaultNone Right argument of the
returned kernel kX Y If None kX X if evaluated instead

evalgradient bool optional defaultFalse Determines whether the gradient with re
spect to the kernel hyperparameter is determined

Returns

1808 Chapter 6 API (Application Programming Interface) Reference

scikitlearn user guide Release 0213

Karray shape nsamplesX nsamplesY nkernels Kernel kX Y

Kgradient array shape nsamplesX nsamplesX ndims nkernels The gradient of the kernel kX X with respect to the hyperparameter of the kernel Only returned when evalgradient is True

bounds

Returns the logtransformed bounds on the theta

Returns

bounds array shape ndims 2 The logtransformed bounds on the kernel's hyperparam

eters theta

clonewiththeta selftheta

Returns a clone of self with given hyperparameters theta

Parameters

theta array shape ndims The hyperparameters

diagselfX

Returns the diagonal of the kernel kX X

The result of this method is identical to npdiagselfX however it can be evaluated more efficiently since only the diagonal is evaluated

Parameters

Xarray shape nsamplesX nfeatures Left argument of the returned kernel kX Y

Returns

Kdiag array shape nsamplesX nkernels Diagonal of kernel kX X

getparams selfdeepTrue

Get parameters of this kernel

Parameters

deep boolean optional If True will return the parameters for this estimator and contained subobjects that are estimators

Returns

params mapping of string to any Parameter names mapped to their values

hyperparameters

Returns a list of all hyperparameter specifications

isstationary self

Returns whether the kernel is stationary

ndims

Returns the number of nonfixed hyperparameters of the kernel

setparams selfparams

Set the parameters of this kernel

The method works on simple kernels as well as on nested kernels The latter have parameters of the form componentparameter so that it's possible to update each component of a nested object

Returns

self

617sklearn gaussianprocess Gaussian Processes 1809

theta

Returns the flattened logtransformed nonfixed hyperparameters

Note that theta are typically the logtransformed values of the kernel’s hyperparameters as this representation of the search space is more amenable for hyperparameter search as hyperparameters like lengthscales naturally live on a logscale

Returns

theta array shape ndims The nonfixed logtransformed hyperparameters of the kernel

6174sklearn Gaussian process kernels ConstantKernel

class sklearn Gaussian process kernels ConstantKernel constantvalue10

constantvaluebounds1e

051000000

Constant kernel

Can be used as part of a productkernel where it scales the magnitude of the other factor kernel or as part of a sumkernel where it modifies the mean of the Gaussian process

kx1 x2 constantvalue for all x1 x2

New in version 018

Parameters

constantvalue float default 10 The constant value which defines the covariance kx1

x2 constantvalue

constantvaluebounds pair of floats 0 default 1e5 1e5 The lower and upper bound on constantvalue

Attributes

bounds Returns the logtransformed bounds on the theta

hyperparameterconstantvalue

hyperparameters Returns a list of all hyperparameter specifications

ndims Returns the number of nonfixed hyperparameters of the kernel

6175sklearnprocesskernels DotProduct

classsklearnprocesskernels DotProduct sigma010 sigma0bounds1e051000000

DotProduct kernel

The DotProduct kernel is nonstationary and can be obtained from linear regression by putting N0 1 priors on the coefficients of $x^T d$ and a prior of N0 sigma02 on the bias The DotProduct

kernel is invariant to a rotation of the coordinates about the origin but not translations It is parameterized by a parameter sigma02 For sigma02 0 the kernel is called the homogeneous linear kernel otherwise it is

inhomogeneous The kernel is given by

$$k(x_i, x_j) = \sigma_0 + \frac{\sigma_0^2}{2} x_i^T x_j$$

The DotProduct kernel is commonly combined with exponentiation

New in version 018

Parameters

sigma0 float 0 default 10 Parameter controlling the inhomogeneity of the kernel If

sigma00 the kernel is homogenous

sigma0bounds pair of floats 0 default 1e5 1e5 The lower and upper bound on l

Returns

theta array shape ndims The nonfixed logtransformed hyperparameters of the kernel

Examples using sklearngaussianprocesskernelsExpSineSquared

- Comparison of kernel ridge and Gaussian process regression
- Illustration of prior and posterior Gaussian process for different kernels
- Gaussian process regression GPR on Mauna Loa CO2 data

6177sklearngaussianprocesskernels Exponentiation

classsklearngaussianprocesskernels Exponentiation kernel exponent

Exponentiate kernel by given exponent

The resulting kernel is defined as $k_{exp}(X, Y) = k(X, Y)^{exponent}$

New in version 018

Parameters

kernel Kernel object The base kernel

exponent float The exponent for the base kernel

Attributes

bounds Returns the logtransformed bounds on the theta

hyperparameters Returns a list of all hyperparameter

ndims Returns the number of nonfixed hyperparameters of the kernel

theta Returns the flattened logtransformed nonfixed hyperparameters

Methods

call self X Y evalgradient Return the kernel $k(X, Y)$ and optionally its gradient

clonewiththeta self theta Returns a clone of self with given hyperparameters

theta

diag self X Returns the diagonal of the kernel $k(X, X)$

getparams self deep Get parameters of this kernel

isstationary self Returns whether the kernel is stationary

setparams self params Set the parameters of this kernel

init selfkernel exponent

call selfXYNone evalgradientFalse

Return the kernel $k(X, Y)$ and optionally its gradient

617sklearngaussianprocess Gaussian Processes 1817

Parameters

Xarray shape nsamplesX nfeatures Left argument of the returned kernel kX Y
Yarray shape nsamplesY nfeatures optional defaultNone Right argument of the returned kernel kX Y If None kX X if evaluated instead
evalgradient bool optional defaultFalse Determines whether the gradient with respect to the kernel hyperparameter is determined

Returns

Karray shape nsamplesX nsamplesY Kernel kX Y
Kgradient array opt shape nsamplesX nsamplesX ndims The gradient of the kernel kX X with respect to the hyperparameter of the kernel Only returned when evalgradient is True

bounds

Returns the logtransformed bounds on the theta

Returns

bounds array shape ndims 2 The logtransformed bounds on the kernel's hyperparameters theta

clonewiththeta selftheta

Returns a clone of self with given hyperparameters theta

Parameters

theta array shape ndims The hyperparameters

diagselfX

Returns the diagonal of the kernel kX X
The result of this method is identical to npdiagselfX however it can be evaluated more efficiently since only the diagonal is evaluated

Parameters

Xarray shape nsamplesX nfeatures Left argument of the returned kernel kX Y

Returns

Kdiag array shape nsamplesX Diagonal of kernel kX X

getparams selfdeepTrue

Get parameters of this kernel

Parameters

deep boolean optional If True will return the parameters for this estimator and contained subobjects that are estimators

Returns

params mapping of string to any Parameter names mapped to their values

hyperparameters

Returns a list of all hyperparameter

isstationary self

Returns whether the kernel is stationary

ndims

Returns the number of nonfixed hyperparameters of the kernel

scikitlearn user guide Release 0213

setparams selfparams

Set the parameters of this kernel

The method works on simple kernels as well as on nested kernels The latter have parameters of the form componentparameter so that it's possible to update each component of a nested object

Returns

self

theta

Returns the flattened logtransformed nonfixed hyperparameters

Note that theta are typically the logtransformed values of the kernel's hyperparameters as this representation of the search space is more amenable for hyperparameter search as hyperparameters like lengthscales naturally live on a logscale

Returns

theta array shape ndims The nonfixed logtransformed hyperparameters of the kernel

6178sklearn Gaussian Process kernels Hyperparameter

class sklearn Gaussian Process kernels Hyperparameter

A kernel hyperparameter's specification in form of a namedtuple

New in version 0.18

Attributes

name string Alias for field number 0

valuetype string Alias for field number 1

bounds pair of floats 0 or "fixed" Alias for field number 2

61710sklearn gaussianprocess kernels Matern

class sklearn gaussianprocess kernels Matern lengthscale10 lengthscale bounds1e

051000000 nu15

Matern kernel

The class of Matern kernels is a generalization of the RBF (Radial Basis Function) and the absolute exponential kernel parameterized by an additional parameter nu The smaller nu the less smooth the approximated function is For nuinf the kernel

617sklearn gaussianprocess Gaussian Processes 1821

scikitlearn user guide Release 0213

becomes equivalent to the RBF (Radial Basis Function) kernel and for nu05 to the absolute exponential kernel Important intermediate values are nu15 once differentiable functions and nu25 twice differentiable functions

See Rasmussen and Williams 2006 pp84 for details regarding the different variants of the Matern kernel

New in version 018

Parameters

lengthscale float or array with shape nfeatures default 10 The length scale of the kernel

If a float an isotropic kernel is used If an array an anisotropic kernel is used where each dimension of l defines the lengthscale of the respective feature dimension

lengthscalebounds pair of floats 0 default 1e5 1e5 The lower and upper bound on lengthscale

nu float default 15 The parameter nu controlling the smoothness of the learned function

The smaller nu the less smooth the approximated function is For nuinf the kernel becomes equivalent to the RBF (Radial Basis Function) kernel and for nu05 to the absolute exponential kernel Important intermediate values are nu15 once differentiable functions and nu25 twice differentiable functions Note that values of nu not in 05 15 25 inf incur a considerably higher computational cost approx 10 times higher since they require to evaluate the modified Bessel function Furthermore in contrast to l nu is kept fixed to its initial value and not optimized

Attributes

anisotropic

bounds Returns the logtransformed bounds on the theta

Returns

self

theta

Returns the flattened logtransformed nonfixed hyperparameters

Note that theta are typically the logtransformed values of the kernel’s hyperparameters as this representation of the search space is more amenable for hyperparameter search as hyperparameters like lengthscales naturally live on a logscale

Returns

theta array shape ndims The nonfixed logtransformed hyperparameters of the kernel

Examples using sklearn.gaussianprocess.kernels.Matern

• Illustration of prior and posterior Gaussian process for different kernels

61711sklearn.gaussianprocess.kernels.PairwiseKernel

class sklearn.gaussianprocess.kernels.PairwiseKernel gamma=10

gamma_bounds=(1e-05,

1000000) metric='linear' pair

wis_kernel_kwargs=None

Wrapper for kernels in sklearn.metrics.pairwise

A thin wrapper around the functionality of the kernels in sklearn.metrics.pairwise

Note Evaluation of eval_gradient is not analytic but numeric and all kernels support only isotropic distances The parameter gamma is considered to be a hyperparameter and may be optimized The other kernel parameters are set directly at initialization and are kept fixed

New in version 0.18

Parameters

gamma float [0, default 10] Parameter gamma of the pairwise kernel specified by metric

gamma_bounds pair of floats [0, default (1e-05, 1e5)] The lower and upper bound on

gamma
metric string or callable [default “linear”] The metric to use when calculating kernel between instances in a feature array If metric is a string it must be one of the metrics in pairwise.PAIRWISE_KERNEL_FUNCTIONS If metric is “precomputed” X is assumed to be a kernel matrix Alternatively if metric is a callable function it is called on each pair of instances rows and the resulting value recorded The callable should take two arrays from X as input and return a value indicating the distance between them

pairwise_kernel_kwargs dict [default None] All entries of this dict if any are passed as keyword arguments to the pairwise kernel function

Attributes

bounds Returns the logtransformed bounds on the theta

hyperparameter_gamma

hyperparameters Returns a list of all hyperparameter specifications

ndims Returns the number of nonfixed hyperparameters of the kernel

61713sklearn Gaussian process kernels RBF (Radial Basis Function)

class sklearn Gaussian process kernels RBF lengthscale10 lengthscale bounds1e05

1000000

Radial basis function kernel aka squared exponential kernel

The RBF (Radial Basis Function) kernel is a stationary kernel It is also known as the "squared exponential" kernel It is parameterized

by a lengthscale parameter lengthscale0 which can either be a scalar isotropic variant of the kernel or a

vector with the same number of dimensions as the inputs X anisotropic variant of the kernel The kernel is

given by

$k(x_i, x_j) = \exp(-\frac{1}{2} \sum_{d=1}^D \frac{(x_{i,d} - x_{j,d})^2}{\text{lengthscale}_d^2})$

This kernel is infinitely differentiable which implies that GPs with this kernel as covariance function have mean

square derivatives of all orders and are thus very smooth

New in version 0.18

1828 Chapter 6 API (Application Programming Interface) Reference

Parameters

lengthscale float or array with shape nfeatures default 10 The length scale of the kernel
If a float an isotropic kernel is used If an array an anisotropic kernel is used where each
dimension of l defines the lengthscale of the respective feature dimension
lengthscalebounds pair of floats 0 default 1e5 1e5 The lower and upper bound on

lengthscale

Attributes

anisotropic

Rational Quadratic kernel

The RationalQuadratic kernel can be seen as a scale mixture an infinite sum of RBF (Radial Basis Function) kernels with different characteristic lengthscales. It is parameterized by a lengthscale parameter lengthscale=0 and a scale mixture parameter alpha=0. Only the isotropic variant where lengthscale is a scalar is supported at the moment. The kernel given by

$$k(x_i, x_j) = \frac{1}{\alpha} \sum_{j=1}^{\infty} \frac{\alpha^j}{2^j j!} \exp\left(-\frac{\alpha^j \|x_i - x_j\|^2}{2^j}\right)$$

New in version 0.18

setparams selfparams

Set the parameters of this kernel

The method works on simple kernels as well as on nested kernels The latter have parameters of the form componentparameter so that it's possible to update each component of a nested object

Returns

self

theta

Returns the flattened logtransformed nonfixed hyperparameters

Note that theta are typically the logtransformed values of the kernel's hyperparameters as this representation of the search space is more amenable for hyperparameter search as hyperparameters like lengthscales naturally live on a logscale

Returns

theta array shape ndims The nonfixed logtransformed hyperparameters of the kernel

61716sklearn Gaussian process kernels WhiteKernel

class sklearn Gaussian process kernels WhiteKernel noiselevel10

noiselevelbounds1e05

1000000

White kernel

The main usecase of this kernel is as part of a sumkernel where it explains the noise component of the signal Tuning its parameter corresponds to estimating the noiselevel

kx1 x2 noiselevel if x1 x2 else 0

617sklearn Gaussian process Gaussian Processes 1835

scikitlearn user guide Release 0213

New in version 018

Parameters

noiselevel float default 10 Parameter controlling the noise level

noiselevelbounds pair of floats 0 default 1e5 1e5 The lower and upper bound on noiselevel

Attributes

bounds Returns the logtransformed bounds on the theta

hyperparameternoiselevel

hyperparameters Returns a list of all hyperparameter specifications

ndims Returns the number of nonfixed hyperparameters of the kernel

theta Returns the flattened logtransformed nonfixed hyperparameters

Methods

call self X Y evalgradient Return the kernel kX Y and optionally its gradient

clonewiththeta self theta Returns a clone of self with given hyperparameters theta

diag self X Returns the diagonal of the kernel kX X

getparams self deep Get parameters of this kernel

isstationary self Returns whether the kernel is stationary

setparams self params Set the parameters of this kernel

init selfnoiselevel10 noiselevelbounds1e05 1000000

call selfXYNone evalgradientFalse

Return the kernel kX Y and optionally its gradient

Parameters

Xarray shape nsamplesX nfeatures Left argument of the returned kernel kX Y

Yarray shape nsamplesY nfeatures optional defaultNone Right argument of the

returned kernel kX Y If None kX X if evaluated instead

evalgradient bool optional defaultFalse Determines whether the gradient with respect to the kernel hyperparameter is determined Only supported when Y is None

Returns

Karray shape nsamplesX nsamplesY Kernel kX Y

Kgradient array opt shape nsamplesX nsamplesX ndims The gradient of the kernel kX X with respect to the hyperparameter of the kernel Only returned when evalgradient is True

bounds

Returns the logtransformed bounds on the theta

Returns

bounds array shape ndims 2 The logtransformed bounds on the kernel’s hyperparameters theta

1836 Chapter 6 API (Application Programming Interface) Reference

scikitlearn user guide Release 0213

clonewiththeta selftheta

Returns a clone of self with given hyperparameters theta

Parameters

theta array shape ndims The hyperparameters

diagselfX

Returns the diagonal of the kernel kX X

The result of this method is identical to npdiagselfX however it can be evaluated more efficiently since only the diagonal is evaluated

Parameters

Xarray shape nsamplesX nfeatures Left argument of the returned kernel kX Y

Returns

Kdiag array shape nsamplesX Diagonal of kernel kX X

getparams selfdeepTrue

Get parameters of this kernel

Parameters

deep boolean optional If True will return the parameters for this estimator and contained subobjects that are estimators

Returns

params mapping of string to any Parameter names mapped to their values

hyperparameters

Returns a list of all hyperparameter specifications

isstationary self

Returns whether the kernel is stationary

ndims

Returns the number of nonfixed hyperparameters of the kernel

setparams selfparams

Set the parameters of this kernel

The method works on simple kernels as well as on nested kernels The latter have parameters of the form componentparameter so that it's possible to update each component of a nested object

Returns

self

theta

Returns the flattened logtransformed nonfixed hyperparameters

Note that theta are typically the logtransformed values of the kernel's hyperparameters as this representation of the search space is more amenable for hyperparameter search as hyperparameters like lengthscales naturally live on a logscale

Returns

theta array shape ndims The nonfixed logtransformed hyperparameters of the kernel

617sklearn gaussianprocess Gaussian Processes 1837

scikitlearn user guide Release 0213

Examples using sklearn.gaussianprocess.kernels.WhiteKernel

- Comparison of kernel ridge and Gaussian process regression
- Gaussian process regression GPR with noiselevel estimation

618sklearn.isotonic Isotonic regression

User guide See the Isotonic regression section for further details

isotonicIsotonicRegression ymin ymax

Isotonic regression model

6181sklearn.isotonic IsotonicRegression

classsklearn.isotonic IsotonicRegression ymin=None ymax=None increasing=True

outofbounds='nan'

Isotonic regression model

The isotonic regression optimization problem is defined by

$\min \sum w_i (y_i - \hat{y}_i)^2$

subject to $\hat{y}_i \leq \hat{y}_j$ whenever $X_i \leq X_j$

and $\min y \leq \hat{y} \leq \max y$

where

- y_i are inputs real numbers
- \hat{y}_i are fitted
- X specifies the order If X is nondecreasing then y is nondecreasing
- w_i are optional strictly positive weights default to 10

Read more in the User Guide

Parameters

ymin optional default None If not None set the lowest value of the fit to ymin

ymax optional default None If not None set the highest value of the fit to ymax

increasing boolean or string optional default True If boolean whether or not to fit the

isotonic regression with y increasing or decreasing

The string value "auto" determines whether y should increase or decrease based on the

Spearman correlation estimate's sign

outofbounds string optional default "nan" The outofbounds parameter handles

how xvalues outside of the training domain are handled When set to "nan" predicted

yvalues will be NaN When set to "clip" predicted yvalues will be set to the value corre

sponding to the nearest train interval endpoint When set to "raise" allow interp1d to

throw ValueError

1838 Chapter 6 API (Application Programming Interface) Reference

scikitlearn user guide Release 0213

Attributes

Xmin float Minimum value of input array Xfor left bound

Xmax float Maximum value of input array Xfor right bound

ffunction The stepwise interpolating function that covers the input domain X

Notes

Ties are broken using the secondary method from Leeuw 1977

Methods

fitself X y sampleweight Fit the model using X y as training data

fittransform self X y Fit to data then transform it

getparams self deep Get parameters for this estimator

predict self T Predict new data by linear interpolation

score self X y sampleweight Returns the coefficient of determination R2 of the pre
diction

setparams self params Set the parameters of this estimator

transform self T Transform new data by linear interpolation

init selfyminNone ymaxNone increasingTrue outofbounds’nan’

fitselfXysampleweightNone

Fit the model using X y as training data

Parameters

Xarraylike shapensamples Training data

yarraylike shapensamples Training target

618sklearnisotonic Isotonic regression 1839

scikitlearn user guide Release 0213

sampleweight arraylike shapensamples optional default None Weights If set to None all weights will be set to 1 equal weights

Returns

self object Returns an instance of self

Notes

X is stored for future use as transform needs X to interpolate new input data

fittransform selfXyNone fitparams

Fit to data then transform it

Fits transformer to X and y with optional parameters fitparams and returns a transformed version of X

Parameters

Xnumpy array of shape nsamples nfeatures Training set

ynumpy array of shape nsamples Target values

Returns

Xnew numpy array of shape nsamples nfeaturesnew Transformed array

getparams selfdeepTrue

Get parameters for this estimator

Parameters

deep boolean optional If True will return the parameters for this estimator and contained

subobjects that are estimators

Returns

params mapping of string to any Parameter names mapped to their values

predictselfT

Predict new data by linear interpolation

Parameters

Tarraylike shapensamples Data to transform

Returns

Tarray shapensamples Transformed data

scoreselfXysampleweightNone

Returns the coefficient of determination R2 of the prediction

The coefficient R2 is defined as $1 - \frac{u}{v}$ where u is the residual sum of squares $y_{true} - y_{pred}$

$2sum$ and v is the total sum of squares $y_{true} - y_{truemean}$ $2sum$ The best possible score

is 1.0 and it can be negative because the model can be arbitrarily worse A constant model that always

predicts the expected value of y disregarding the input features would get a R2 score of 0.0

Parameters

Xarraylike shape nsamples nfeatures Test samples For some estimators this may

be a precomputed kernel matrix instead shape nsamples nsamplesfitted where

nsamplesfitted is the number of samples used in the fitting for the estimator

yarraylike shape nsamples or nsamples noutputs True values for X

1840 Chapter 6 API (Application Programming Interface) Reference

scikitlearn user guide Release 0213

sampleweight arraylike shape nsamples optional Sample weights

Returns

score float R2 of selfpredictX wrt y

Notes

The R2 score used when calling score on a regressor will use multioutputuniformaverage from version 023 to keep consistent with metricsr2score This will influence the score method of all the multioutput regressors except for multioutputMultiOutputRegressor

To specify the default value manually and avoid the warning please either call metricsr2score directly or make a custom scorer with metricsmakescorer the builtin scorer r2 uses multioutputuniformaverage

setparams selfparams

Set the parameters of this estimator

The method works on simple estimators as well as on nested objects such as pipelines The latter have parameters of the form componentparameter so that it's possible to update each component of a nested object

Returns

self

transform selfT

Transform new data by linear interpolation

Parameters

Tarraylike shapensamples Data to transform

Returns

Tarray shapensamples The transformed data

Examples using sklearnisotonicIsotonicRegression

•Isotonic Regression

isotoniccheckincreasing x y Determine whether y is monotonically correlated with x

isotonicisotonicregression y Solve the isotonic regression model

6182sklearnisotonic checkincreasing

sklearnisotonic checkincreasing xy

Determine whether y is monotonically correlated with x

y is found increasing or decreasing with respect to x based on a Spearman correlation test

Parameters

xarraylike shapensamples Training data

yarraylike shapensamples Training target

Returns

618sklearnisotonic Isotonic regression 1841

scikitlearn user guide Release 0213

increasingbool boolean Whether the relationship is increasing or decreasing

Notes

The Spearman correlation coefficient is estimated from the data and the sign of the resulting estimate is used as the result

In the event that the 95 confidence interval based on Fisher transform spans zero a warning is raised

imputeSimpleImputer missingvalues Imputation transformer for completing missing values

imputeliterativeImputer estimator Multivariate imputer that estimates each feature from all the others

imputeMissingIndicator missingvalues Binary indicators for missing values

6191sklearnimpute SimpleImputer

classssklearnimpute SimpleImputer missingvaluesnan strategy‘mean’ fillvalueNone ver

bose0 copyTrue addindicatorFalse

Imputation transformer for completing missing values

Read more in the User Guide

Parameters

missingvalues number string nnan default or None The placeholder for the missing

values All occurrences of missingvalues will be imputed

strategy string optional default“mean” The imputation strategy

- If “mean” then replace missing values using the mean along each column Can only be used with numeric data

- If “median” then replace missing values using the median along each column Can only be used with numeric data

- If “mostfrequent” then replace missing using the most frequent value along each column Can be used with strings or numeric data

- If “constant” then replace missing values with fillvalue Can be used with strings or numeric data

New in version 020 strategy“constant” for fixed value imputation

fillvalue string or numerical value optional defaultNone When strategy “constant”

fillvalue is used to replace all occurrences of missingvalues If left to the default fillvalue will be 0 when imputing numerical data and “missingvalue” for strings or object data types

verbose integer optional default0 Controls the verbosity of the imputer

copy boolean optional defaultTrue If True a copy of X will be created If False imputation will be done inplace whenever possible Note that in the following cases a new copy will

always be made even if copyFalse

- If X is not an array of floating values

- If X is encoded as a CSR (Compressed Sparse Row) matrix

- If addindicatorTrue

addindicator boolean optional defaultFalse If True a MissingIndicator transform

will stack onto output of the imputer’s transform This allows a predictive estimator to

account for missingness despite imputation If a feature has no missing values at fittrain

619sklearnimpute Impute 1843

scikitlearn user guide Release 0213

time the feature won't appear on the missing indicator even if there are missing values at transformtest time

Attributes

statistics array of shape nfeatures The imputation fill value for each feature

indicator sklearnimputeMissingIndicator Indicator used to add binary indi

cators for missing values None if addindicator is False

IterativeImputer Multivariate imputation of missing values

Notes

Columns which only contained missing values at fit are discarded upon transform if strategy is not "constant"

Examples

```
import numpy as np
from sklearnimpute import SimpleImputer
impmean = SimpleImputer(missing_values=np.nan, strategy='mean')
impmean.fit(7 2 3 4 np.nan 6 10 5 9)
```

SimpleImputer(add_indicator=False, copy=True, fill_value=None,

missing_values=np.nan, strategy='mean', verbose=0)

X = np.array([[2, 3, 4, np.nan, 6, 10, np.nan, 9],

print(impmean.transform(X))

```
7 2 3
4 35 6
10 35 9
```

Methods

fit(self, X, y) Fit the imputer on X

fit_transform(self, X, y) Fit to data then transform it

get_params(self, deep=True) Get parameters for this estimator

set_params(self, **params) Set the parameters of this estimator

transform(self, X) Impute all missing values in X

init(self, missing_values=np.nan, strategy='mean', fill_value=None, verbose=0, copy=True,

add_indicator=False)

fit(self, X, y=None)

Fit the imputer on X

Parameters

X array-like sparse matrix shape (n_samples, n_features) Input data where

n_samples is the number of samples and n_features is the number of features

1844 Chapter 6 API (Application Programming Interface) Reference

scikitlearn user guide Release 0213

Returns

self SimpleImputer

fittransform selfXyNone fitparams

Fit to data then transform it

Fits transformer to X and y with optional parameters fitparams and returns a transformed version of X

Parameters

Xnumpy array of shape nsamples nfeatures Training set

ynumpy array of shape nsamples Target values

Returns

Xnew numpy array of shape nsamples nfeaturesnew Transformed array

getparams selfdeepTrue

Get parameters for this estimator

Parameters

deep boolean optional If True will return the parameters for this estimator and contained

subobjects that are estimators

Returns

params mapping of string to any Parameter names mapped to their values

setparams selfparams

Set the parameters of this estimator

The method works on simple estimators as well as on nested objects such as pipelines The latter have

parameters of the form componentparameter so that it's possible to update each component

of a nested object

Returns

self

transform selfX

Impute all missing values in X

Parameters

Xarraylike sparse matrix shape nsamples nfeatures The input data to complete

Examples using sklearnimputeSimpleImputer

•Column Transformer with Mixed Types

•Imputing missing values with variants of IterativeImputer

nnearestfeaturesNone initialstrategy'mean'

imputationorder'ascending' minvalueNone

maxvalueNone verbose0 randomstateNone

addindicatorFalse

Multivariate imputer that estimates each feature from all the others

A strategy for imputing missing values by modeling each feature with missing values as a function of other features in a roundrobin fashion

Read more in the User Guide

Note This estimator is still experimental for now the predictions and the API (Application Programming Interface) might change without any deprecation cycle To use it you need to explicitly import enableiterativeimputer

explicitly require this experimental feature

from sklearnexperimental import enableiterativeimputer noqa

now you can import normally from sklearnimpute

from sklearnimpute import IterativeImputer

Parameters

estimator estimator object defaultBayesianRidge The estimator to use at each step of the roundrobin imputation If sampleposterior is True the estimator must support

returnstd in itspredict method

missingvalues int npnan optional defaultnpnan The placeholder for the missing values

All occurrences of missingvalues will be imputed

sampleposterior boolean defaultFalse Whether to sample from the Gaussian predictive posterior of the fitted estimator for each imputation Estimator must support returnstd

in itspredict method if set to True Set toTrue if usingIterativeImputer for

multiple imputations

maxiter int optional default10 Maximum number of imputation rounds to perform

before returning the imputations computed during the final round A round is a sin

gle imputation of each feature with missing values The stopping criterion is met

onceabsmaxXt Xt1absmaxXknownvals tol where

Xt isXat iteration t Note that early stopping is only applied if

sampleposteriorFalse

tolfloat optional default1e3 Tolerance of the stopping condition

nnearestfeatures int optional defaultNone Number of other features to use to estimate the missing values of each feature column Nearness between features is measured using

the absolute correlation coefficient between each feature pair after initial imputation To ensure coverage of features throughout the imputation process the neighbor features are

not necessarily nearest but are drawn with probability proportional to correlation for each imputed target feature Can provide significant speedup when the number of features is

huge IfNone all features will be used

initialstrategy str optional default"mean" Which strategy to use to initialize the missing values Same as the strategy parameter in sklearnimputeSimpleImputer

Valid values "mean" "median" "mostfrequent" or "constant"

1846 Chapter 6 API (Application Programming Interface) Reference

scikitlearn user guide Release 0213

imputationorder str optional default"ascending" The order in which the features will be imputed Possible values

"ascending" From features with fewest missing values to most

"descending" From features with most missing values to fewest

"roman" Left to right

"arabic" Right to left

"random" A random order for each round

minvalue float optional defaultNone Minimum possible imputed value Default of None will set minimum to negative infinity

maxvalue float optional defaultNone Maximum possible imputed value Default of None will set maximum to positive infinity

verbose int optional default0 Verbosity flag controls the debug messages that are issued as functions are evaluated The higher the more verbose Can be 0 1 or 2

randomstate int RandomState instance or None optional defaultNone The seed of the pseudo random number generator to use Randomizes selection of estimator features if nnearestfeatures is not None the imputationorder ifrandom and the sampling from posterior if sampleposterior is True Use an integer for determinism See the Glossary

addindicator boolean optional defaultFalse If True a MissingIndicator transform will stack onto output of the imputer's transform This allows a predictive estimator to account for missingness despite imputation If a feature has no missing values at fittrain time the feature won't appear on the missing indicator even if there are missing values at transformtest time

Attributes

initialimputer object of type sklearnimputeSimpleImputer Imputer used to initialize the missing values

imputationsequence list of tuples Each tuple has featidx

neighborfeatidx estimator wherefeatidx is the current feature

to be imputed neighborfeatidx is the array of other features used to impute the current feature and estimator is the trained estimator used for the imputation Length isselfnfeatureswithmissing selfniter

niter int Number of iteration rounds that occurred Will be less than selfmaxiter if early stopping criterion was reached

nfeatureswithmissing int Number of features with missing values

indicator sklearnimputeMissingIndicator Indicator used to add binary indicators for missing values None if addindicator is False

See also

SimpleImputer Univariate imputation of missing values

Notes

To support imputation in inductive mode we store each feature's estimator during the fit phase and predict without refitting in order during the transform phase

619sklearnimpute Impute 1847

scikitlearn user guide Release 0213

Features which contain all missing values at fit are discarded upon transform

Features with missing values during transform which did not have any missing values during fit will be imputed with the initial imputation method only

setparams selfparams

Set the parameters of this estimator

The method works on simple estimators as well as on nested objects such as pipelines The latter have parameters of the form componentparameter so that it's possible to update each component of a nested object

Returns

self

transform selfX

Imputes all missing values in X

Note that this is stochastic and that if randomstate is not fixed repeated calls or permuted input will yield different results

Parameters

Xarraylike shape nsamples nfeatures The input data to complete

Returns

Xarraylike shape nsamples nfeatures The imputed input data

Examples using sklearnimputeliterativeImputer

- Imputing missing values with variants of IterativeImputer
- Imputing missing values before building an estimator

6193sklearnimpute MissingIndicator

classsklearnimpute MissingIndicator missingvaluesnan features'missingonly'

sparse'auto' erroronnewTrue

Binary indicators for missing values

Note that this component typically should not be used in a vanilla Pipeline consisting of transformers and a classifier but rather could be added using a FeatureUnion orColumnTransformer

Read more in the User Guide

Parameters

missingvalues number string npnan default or None The placeholder for the missing

values All occurrences of missingvalues will be indicated True in the output array the other values will be marked as False

features str optional Whether the imputer mask should represent all or a subset of features

- If "missingonly" default the imputer mask will only represent features containing

missing values during fit time

- If "all" the imputer mask will represent all features

sparse boolean or "auto" optional Whether the imputer mask format should be sparse or dense

- If "auto" default the imputer mask will be of same type as input

- If True the imputer mask will be a sparse matrix

619sklearnimpute Impute 1849

scikitlearn user guide Release 0213

• If False the imputer mask will be a numpy array
erroronnew boolean optional If True default transform will raise an error when there
are features with missing values in transform that have no missing values in fit This is
applicable only when featuresmissingonly

Attributes

features ndarray shape nmissingfeatures or nfeatures The features indices which
will be returned when calling transform They are computed during fit For
featuresall it is torangenfeatures

Examples

```
import numpy as np
from sklearn.impute import MissingIndicator
X1 = np.array(np.nan, 1, 3)
      4, 0, np.nan
      8, 1, 0

form

6201sklearnkernelapproximation AdditiveChi2Sampler

classsklearnkernelapproximation AdditiveChi2Sampler samplesteps2 sam

pleintervalNone

Approximate feature map for additive chi2 kernel

Uses sampling the fourier transform of the kernel characteristic at regular intervals

Since the kernel that is to be approximated is additive the components of the input vectors can be treated separately Each entry in the original space is transformed into 2samplesteps1 features where samplesteps

is a parameter of the method Typical values of samplesteps include 1 2 and 3

Optimal choices for the sampling interval for certain data ranges can be computed see the reference The

default values should be reasonable

Read more in the User Guide

Parameters

samplesteps int optional Gives the number of complex sampling points

sampleinterval float optional Sampling interval Must be specified when samplesteps not

in 123

fitselfXyNone

Fit estimator to data

Samples a subset of training points computes kernel on these and computes normalization matrix

Parameters

Xarraylike shapensamples nfeature Training data

fittransform selfXyNone fitparams

Fit to data then transform it

Fits transformer to X and y with optional parameters fitparams and returns a transformed version of X

Parameters

Xnumpy array of shape nsamples nfeatures Training set

ynumpy array of shape nsamples Target values

Returns

Xnew numpy array of shape nsamples nfeaturesnew Transformed array

getparams selfdeepTrue

Get parameters for this estimator

Parameters

deep boolean optional If True will return the parameters for this estimator and contained

subobjects that are estimators

Returns

params mapping of string to any Parameter names mapped to their values

setparams selfparams

Set the parameters of this estimator

The method works on simple estimators as well as on nested objects such as pipelines The latter have

parameters of the form componentparameter so that it's possible to update each component

of a nested object

Returns

self

transform selfX

Apply feature map to X

Computes an approximate feature map using the kernel between some training points and X

Parameters

Xarraylike shapensamples nfeatures Data to transform

Returns

Xtransformed array shapensamples ncomponents Transformed data

Examples using sklearnkernelapproximationNystroem

•Explicit feature map approximation for RBF (Radial Basis Function) kernels

621sklearnkernelridge Kernel Ridge Regression

Modulesklearnkernelridge implements kernel ridge regression

User guide See the Kernel ridge regression section for further details

kernelridgeKernelRidge alpha kernel Kernel ridge regression

6211sklearnkernelridge KernelRidge

classssklearnkernelridge KernelRidge alpha1 kernel’linear’ gammaNone degree3

coef01 kernelparamsNone

Kernel ridge regression

Kernel ridge regression KRR combines ridge regression linear least squares with l2norm regularization with the kernel trick It thus learns a linear function in the space induced by the respective kernel and the data For nonlinear kernels this corresponds to a nonlinear function in the original space

The form of the model learned by KRR is identical to support vector regression SVR (Support Vector Regression) However different loss functions are used KRR uses squared error loss while support vector regression uses epsiloninsensitive loss

both combined with l2 regularization In contrast to SVR (Support Vector Regression) fitting a KRR model can be done in closedform and is typically faster for mediumsized datasets On the other hand the learned model is nonsparse and thus slower

than SVR (Support Vector Regression) which learns a sparse model for epsilon 0 at predictiontime

This estimator has builtin support for multivariate regression ie when y is a 2darray of shape nsamples

ntargets

Read more in the User Guide

Parameters

alpha float arraylike shape ntargets Small positive values of alpha improve the conditioning of the problem and reduce the variance of the estimates Alpha corresponds to 2C1 in other linear models such as LogisticRegression or LinearSVC If an array is 621sklearnkernelridge Kernel Ridge Regression 1861

scikitlearn user guide Release 0213

passed penalties are assumed to be specific to the targets Hence they must correspond in number

kernel string or callable default"linear" Kernel mapping used internally A callable should accept two arguments and the keyword arguments passed to this object as kernelparams and should return a floating point number Set to "precomputed" in order to pass a precomputed kernel matrix to the estimator methods instead of samples

gamma float defaultNone Gamma parameter for the RBF (Radial Basis Function) laplacian polynomial exponential chi2 and sigmoid kernels Interpretation of the default value is left to the kernel see the documentation for sklearnmetricspairwise Ignored by other kernels

degree float default3 Degree of the polynomial kernel Ignored by other kernels

coef0 float default1 Zero coefficient for polynomial and sigmoid kernels Ignored by other kernels

kernelparams mapping of string to any optional Additional parameters keyword arguments for kernel function passed as callable object

Attributes

dualcoef array shape nsamples or nsamples ntargets Representation of weight vectors in kernel space

Xfit arraylike sparse matrix shape nsamples nfeatures Training data which is also required for prediction If kernel "precomputed" this is instead the precomputed training matrix shape nsamples nsamples

scikitlearn user guide Release 0213

Evidence Maximization

Read more in the User Guide

Parameters

niter int optional Maximum number of iterations Default is 300

tolfloat optional Stop the algorithm if w has converged Default is 1e3

alpha1 float optional Hyperparameter shape parameter for the Gamma distribution prior over the alpha parameter Default is 1e6

alpha2 float optional Hyperparameter inverse scale parameter rate parameter for the Gamma distribution prior over the alpha parameter Default is 1e6

lambda1 float optional Hyperparameter shape parameter for the Gamma distribution prior over the lambda parameter Default is 1e6

lambda2 float optional Hyperparameter inverse scale parameter rate parameter for the Gamma distribution prior over the lambda parameter Default is 1e6

computescore boolean optional If True compute the objective function at each step of the model Default is False

thresholdlambda float optional threshold for removing pruning weights with high precision from the computation Default is 1e4

fitintercept boolean optional whether to calculate the intercept for this model If set to false no intercept will be used in calculations eg data is expected to be already centered Default is True

normalize boolean optional default False This parameter is ignored when

fitintercept is set to False If True the regressors X will be normalized before regression by subtracting the mean and dividing by the l2norm If you wish to standardize please use sklearnpreprocessingStandardScaler before callingfit on an estimator with normalizeFalse

copyX boolean optional default True If True X will be copied else it may be overwritten

verbose boolean optional default False Verbose mode when fitting the model

Attributes

coef array shape nfeatures Coefficients of the regression model mean of distribution

alpha float estimated precision of the noise

lambda array shape nfeatures estimated precisions of the weights

sigma array shape nfeatures nfeatures estimated variancecovariance matrix of the weights

scores float if computed value of the objective function to be maximized

verbose=False)
clf.predict(1 1
array(1
```

Methods

`fit(self, X, y)` Fit the ARDRegression model according to the given training data and parameters
`get_params(self, deep=True)` Get parameters for this estimator
`predict(self, X, return_std=False)` Predict using the linear model
`score(self, X, y, sample_weight=None)` Returns the coefficient of determination R^2 of the prediction
`set_params(self, **params)` Set the parameters of this estimator
`init(self, n_iter=300, tol=0.001, alpha1=1e-06, alpha2=1e-06, lambda1=1e-06, lambda2=1e-06, compute_score=False, threshold_lambda=100000, fit_intercept=True, normalize=False, copy_X=True, verbose=False)`
`fit(self, X, y)`

Fit the ARDRegression model according to the given training data and parameters
Iterative procedure to maximize the evidence

Parameters

`X` array-like shape (n_samples, n_features) Training vector where n_samples is the number of samples and n_features is the number of features
`y` array shape (n_samples,) Target values integers Will be cast to X's dtype if necessary
Returns

`self` returns an instance of self
`get_params(self, deep=True)`
Get parameters for this estimator
Parameters

622sklearn.linear_model.Generalized Linear Models 1867

scikitlearn user guide Release 0213

deep boolean optional If True will return the parameters for this estimator and contained subobjects that are estimators

Returns

params mapping of string to any Parameter names mapped to their values

predictselfXreturnstdFalse

Predict using the linear model

In addition to the mean of the predictive distribution also its standard deviation can be returned

Parameters

Xarraylike sparse matrix shape nsamples nfeatures Samples

returnstd boolean optional Whether to return the standard deviation of posterior prediction

Returns

ymean array shape nsamples Mean of predictive distribution of query points

ystd array shape nsamples Standard deviation of predictive distribution of query points

scoreselfXysampleweightNone

Returns the coefficient of determination R2 of the prediction

The coefficient R2 is defined as $1 - \frac{u}{v}$ where u is the residual sum of squares $y_{true} - y_{pred}$

$2sum$ and v is the total sum of squares $y_{true} - y_{truemean}$ $2sum$ The best possible score

is 10 and it can be negative because the model can be arbitrarily worse A constant model that always

predicts the expected value of y disregarding the input features would get a R2 score of 00

Parameters

Xarraylike shape nsamples nfeatures Test samples For some estimators this may

be a precomputed kernel matrix instead shape nsamples nsamplesfitted where

nsamplesfitted is the number of samples used in the fitting for the estimator

yarraylike shape nsamples or nsamples noutputs True values for X

sampleweight arraylike shape nsamples optional Sample weights

Returns

score float R2 of selfpredictX wrt y

Notes

The R2 score used when calling score on a regressor will use multioutputuniformaverage

from version 023 to keep consistent with metricsr2score This will influence the score

method of all the multioutput regressors except for multioutputMultiOutputRegressor

To specify the default value manually and avoid the warning please either call metricsr2score

directly or make a custom scorer with metricsmakescorer the builtin scorer r2 uses

multioutputuniformaverage

setparams selfparams

Set the parameters of this estimator

The method works on simple estimators as well as on nested objects such as pipelines The latter have

parameters of the form componentparameter so that it's possible to update each component

of a nested object

alpha1 float optional Hyperparameter shape parameter for the Gamma distribution prior over the alpha parameter Default is 1e6

alpha2 float optional Hyperparameter inverse scale parameter rate parameter for the Gamma distribution prior over the alpha parameter Default is 1e6

lambda1 float optional Hyperparameter shape parameter for the Gamma distribution prior over the lambda parameter Default is 1e6

lambda2 float optional Hyperparameter inverse scale parameter rate parameter for the Gamma distribution prior over the lambda parameter Default is 1e6

computescore boolean optional If True compute the log marginal likelihood at each iteration of the optimization Default is False

fitintercept boolean optional default True Whether to calculate the intercept for this model The intercept is not treated as a probabilistic parameter and thus has no associated variance

If set to False no intercept will be used in calculations eg data is expected to be already centered

normalize boolean optional default False This parameter is ignored when fitintercept is set to False If True the regressors X will be normalized before regression by subtracting the mean and dividing by the l2norm If you wish to

standardize please use sklearnpreprocessingStandardScaler before callingfit on an estimator with normalizeFalse

copyX boolean optional default True If True X will be copied else it may be overwritten

verbose boolean optional default False Verbose mode when fitting the model

Attributes

coef array shape nfeatures Coefficients of the regression model mean of distribution

622sklearnlinearmodel Generalized Linear Models 1869

scikitlearn user guide Release 0213

intercept float Independent term in decision function Set to 00 if fitintercept
False

alpha float Estimated precision of the noise

lambda float Estimated precision of the weights

sigma array shape nfeatures nfeatures Estimated variancecovariance matrix of the
weights

scores array shape niter 1 If computedscore is True value of the log marginal
likelihood to be maximized at each iteration of the optimization The array starts with the
value of the log marginal likelihood obtained for the initial values of alpha and lambda and
ends with the value obtained for the estimated alpha and lambda

niter int The actual number of iterations to reach the stopping criterion

Notes

There exist several strategies to perform Bayesian ridge regression This implementation is based on the algo
rithm described in Appendix A of Tipping 2001 where updates of the regularization parameters are done as
suggested in MacKay 1992 Note that according to A New View of Automatic Relevance Determination Wipf
and Nagarajan 2008 these update rules do not guarantee that the marginal likelihood is increasing between two
consecutive iterations of the optimization

getparams selfdeepTrue

Get parameters for this estimator

Parameters

deep boolean optional If True will return the parameters for this estimator and contained

subobjects that are estimators

Returns

params mapping of string to any Parameter names mapped to their values

predictselfXreturnstdFalse

Predict using the linear model

In addition to the mean of the predictive distribution also its standard deviation can be returned

Parameters

Xarraylike sparse matrix shape nsamples nfeatures Samples

returnstd boolean optional Whether to return the standard deviation of posterior predic

tion

Returns

ymean array shape nsamples Mean of predictive distribution of query points

ystd array shape nsamples Standard deviation of predictive distribution of query

points

scoreselfXysampleweightNone

Returns the coefficient of determination R2 of the prediction

The coefficient R2 is defined as $1 - \frac{u}{v}$ where u is the residual sum of squares $y_{true} - y_{pred}$

2sum and v is the total sum of squares $y_{true} - y_{true\text{mean}}$ 2sum The best possible score

is 10 and it can be negative because the model can be arbitrarily worse A constant model that always

predicts the expected value of y disregarding the input features would get a R2 score of 00

Parameters

622sklearnlinearmodel Generalized Linear Models 1871

scikitlearn user guide Release 0213

Xarraylike shape nsamples nfeatures Test samples For some estimators this may be a precomputed kernel matrix instead shape nsamples nsamplesfitted where nsamplesfitted is the number of samples used in the fitting for the estimator yarraylike shape nsamples or nsamples noutputs True values for X sampleweight arraylike shape nsamples optional Sample weights

Returns

score float R2 of selfpredictX wrt y

Notes

The R2 score used when calling score on a regressor will use multioutputuniformaverage from version 023 to keep consistent with metricsr2score This will influence the score method of all the multioutput regressors except for multioutputMultiOutputRegressor To specify the default value manually and avoid the warning please either call metricsr2score directly or make a custom scorer with metricsmakescorer the builtin scorer r2 uses multioutputuniformaverage setparams selfparams

Set the parameters of this estimator

The method works on simple estimators as well as on nested objects such as pipelines The latter have parameters of the form componentparameter so that it’s possible to update each component of a nested object

Returns

self

Minimizes the objective function

1 2nsamples y Xw22

alpha l1ratio w1

05alpha1 l1ratio w22

If you are interested in controlling the L1 and L2 penalty separately keep in mind that this is equivalent to

aL1 bL2

1872 Chapter 6 API (Application Programming Interface) Reference

where
 $\alpha = \frac{a}{a+b}$ and $\lambda_{ratio} = \frac{a}{a+b}$
The parameter λ_{ratio} corresponds to α in the glmnet R package while α corresponds to the λ parameter in glmnet Specifically $\lambda_{ratio} = 1$ is the lasso penalty Currently $\lambda_{ratio} = 0.01$ is not reliable unless you supply your own sequence of α
Read more in the User Guide
Parameters

α float optional Constant that multiplies the penalty terms Defaults to 10 See the notes for the exact mathematical meaning of this parameter “ $\alpha = 0$ ” is equivalent to an ordinary least square solved by the LinearRegression object For numerical reasons using $\alpha = 0$ with the Lasso object is not advised Given this you should use the LinearRegression object
 λ_{ratio} float The ElasticNet mixing parameter with 0 $\lambda_{ratio} = 1$ For $\lambda_{ratio} = 0$ the penalty is an L2 penalty For $\lambda_{ratio} = 1$ it is an L1 penalty For 0 $\lambda_{ratio} = 1$ the penalty is a combination of L1 and L2
 fit_intercept bool Whether the intercept should be estimated or not If False the data is assumed to be already centered
 normalize boolean optional default False This parameter is ignored when fit_intercept is set to False If True the regressors X will be normalized before regression by subtracting the mean and dividing by the ℓ_2 norm If you wish to standardize please use sklearn.preprocessing.StandardScaler before calling fit on an estimator with $\text{normalize} = \text{False}$
 precompute True False arraylike Whether to use a precomputed Gram matrix to speed up calculations The Gram matrix can also be passed as argument For sparse input this option is always True to preserve sparsity
 max_iter int optional The maximum number of iterations
 copy_X boolean optional default True If True X will be copied else it may be overwritten
 tol float optional The tolerance for the optimization if the updates are smaller than tol the optimization code checks the dual gap for optimality and continues until it is smaller than tol
 warm_start bool optional When set to True reuse the solution of the previous call to fit as initialization otherwise just erase the previous solution See the Glossary
 positive bool optional When set to True forces the coefficients to be positive
 random_state int RandomState instance or None optional default None The seed of the pseudo random number generator that selects a random feature to update If int random_state is the seed used by the random number generator If RandomState instance random_state is the random number generator If None the random number generator is the RandomState instance used by np.random Used when selection ‘random’
 selection str default ‘cyclic’ If set to ‘random’ a random coefficient is updated every iteration rather than looping over features sequentially by default This setting to ‘random’ often leads to significantly faster convergence especially when tol is higher than $1e4$

Attributes

scikitlearn user guide Release 0213

Notes

For an example see `examples/linear_model/plot_lasso_coordinated_descent_path.py`

`predict_selfX`

Predict using the linear model

Parameters

Xarraylike or sparse matrix shape `nsamples nfeatures` Samples

Returns

Carray shape `nsamples` Returns predicted values

`score_selfXysampleweight`None

Returns the coefficient of determination R^2 of the prediction

The coefficient R^2 is defined as $1 - \frac{u}{v}$ where u is the residual sum of squares $y_{true} - y_{pred}$

$2sum$ and v is the total sum of squares $y_{true} - y_{truemean}$ $2sum$ The best possible score

is 1.0 and it can be negative because the model can be arbitrarily worse A constant model that always

predicts the expected value of y disregarding the input features would get a R^2 score of 0.0

Parameters

Xarraylike shape `nsamples nfeatures` Test samples For some estimators this may

be a precomputed kernel matrix instead shape `nsamples nsamplesfitted` where

`nsamplesfitted` is the number of samples used in the fitting for the estimator

yarraylike shape `nsamples` or `nsamples noutputs` True values for X

sampleweight arraylike shape `nsamples` optional Sample weights

Returns

score float R^2 of `self.predictX` wrt y

Notes

The R^2 score used when calling `score` on a regressor will use `multioutputuniformaverage`

from version 0.23 to keep consistent with `metricsr2score` This will influence the score

method of all the multioutput regressors except for `MultiOutputRegressor`

To specify the default value manually and avoid the warning please either call `metricsr2score`

directly or make a custom scorer with `metricsmakescorer` the builtin scorer `r2` uses

`multioutputuniformaverage`

`setparams selfparams`

Set the parameters of this estimator

The method works on simple estimators as well as on nested objects such as pipelines The latter have

parameters of the form `componentparameter` so that it's possible to update each component

of a nested object

Returns

self

`sparsecoef`

sparse representation of the fitted coef

622sklearnlinear_model Generalized Linear Models 1877

scikitlearn user guide Release 0213

Examples using sklearnlinearmodelElasticNet

- Lasso and Elastic Net for Sparse Signals

- Train error vs Test error

6224sklearnlinearmodel HuberRegressor

classsklearnlinearmodel HuberRegressor epsilon135 maxiter100 alpha00001

warmstartFalse fitinterceptTrue tol1e05

Linear regression model that is robust to outliers

The Huber Regressor optimizes the squared loss for the samples where $y - Xw \leq \sigma$

epsilon and the absolute loss for the samples where $y - Xw > \sigma$ where w

and sigma are parameters to be optimized The parameter sigma makes sure that if y is scaled up or down by a

certain factor one does not need to rescale epsilon to achieve the same robustness Note that this does not take

into account the fact that the different features of X may be of different scales

This makes sure that the loss function is not heavily influenced by the outliers while not completely ignoring

their effect

Read more in the User Guide

New in version 018

Parameters

epsilon float greater than 10 default 135 The parameter epsilon controls the number of

samples that should be classified as outliers The smaller the epsilon the more robust it is

to outliers

maxiter int default 100 Maximum number of iterations that scipyoptimizefminlbfgsb

should run for

alpha float default 00001 Regularization parameter

warmstart bool default False This is useful if the stored attributes of a previously used

model has to be reused If set to False then the coefficients will be rewritten for every call

to fit See the Glossary

fitintercept bool default True Whether or not to fit the intercept This can be set to False if

the data is already centered around the origin

tolfloat default 1e5 The iteration will stop when $\max_j |g_i| \leq 1$

ntol where g_i is the i th component of the projected gradient

Attributes

coef array shape nfeatures Features got by optimizing the Huber loss

intercept float Bias

scale float The value by which $y - Xw - c$ is scaled down

niter int Number of iterations that fminlbfgsb has run for

Changed in version 020 In SciPy 100 the number of lbfgs iterations may exceed

maxiter niter will now report at most maxiter

outliers array shape nsamples A boolean mask which is set to True where the samples

are identified as outliers

Linear Model trained with L1 prior as regularizer aka the Lasso

The optimization objective for Lasso is

$$\frac{1}{2} \|y - Xw\|_2^2 + \alpha \|w\|_1$$

Technically the Lasso model is optimizing the same objective function as the Elastic Net with l1ratio10

no L2 penalty

Read more in the User Guide

Parameters

alpha float optional Constant that multiplies the L1 term Defaults to 10 alpha 0 is

equivalent to an ordinary least square solved by the LinearRegression object For

numerical reasons using alpha 0 with theLasso object is not advised Given this

you should use the LinearRegression object

fitintercept boolean optional default True Whether to calculate the intercept for this model

If set to False no intercept will be used in calculations eg data is expected to be already centered

normalize boolean optional default False This parameter is ignored when

fitintercept is set to False If True the regressors X will be normalized be

fore regression by subtracting the mean and dividing by the l2norm If you wish to

standardize please use sklearnpreprocessingStandardScaler before

callingfit on an estimator with normalizeFalse

precompute True False arraylike defaultFalse Whether to use a precomputed Gram ma

trix to speed up calculations If set to auto let us decide The Gram matrix can also be

passed as argument For sparse input this option is always True to preserve sparsity

copyX boolean optional default True If True X will be copied else it may be overwritten

maxiter int optional The maximum number of iterations

tolfloat optional The tolerance for the optimization if the updates are smaller than tol the

optimization code checks the dual gap for optimality and continues until it is smaller than tol

warmstart bool optional When set to True reuse the solution of the previous call to fit as

initialization otherwise just erase the previous solution See the Glossary

positive bool optional When set to True forces the coefficients to be positive

1884 Chapter 6 API (Application Programming Interface) Reference

scikitlearn user guide Release 0213

randomstate int RandomState instance or None optional default None The seed of the pseudo random number generator that selects a random feature to update If int randomstate is the seed used by the random number generator If RandomState instance randomstate is the random number generator If None the random number generator is the RandomState instance used by nprandom Used when selection 'random' selection str default 'cyclic' If set to 'random' a random coefficient is updated every iteration rather than looping over features sequentially by default This setting to 'random' often leads to significantly faster convergence especially when tol is higher than 1e4

Attributes

coef array shape nfeatures ntargets nfeatures parameter vector w in the cost function formula
sparsecoef scipy sparse matrix shape nfeatures 1 ntargets nfeatures sparse representation of the fitted coef
intercept float array shape ntargets independent term in decision function
niter int arraylike shape ntargets number of iterations run by the coordinate descent solver to reach the specified tolerance

Notes

The algorithm used to fit the model is coordinate descent
To avoid unnecessary memory duplication the X argument of the fit method should be directly passed as a Fortran contiguous numpy array

Examples

```
from sklearn import linear_model
clf = linear_model.Lasso(alpha=0.1)
clf.fit(X, y)
```

```
Lasso(alpha=0.1, copy_X=True, fit_intercept=True, max_iter=1000,
normalize=False, positive=False, precompute=False, random_state=None,
selection=cyclic, tol=0.0001, warm_start=False)
print(clf.coef_)
0.85 0
print(clf.intercept_)
0.15
622sklearn.linear_model.Generalized Linear Models 1885
```

Methods

Fit model with coordinate descent

Parameters

Xndarray or scipysparse matrix nsamples nfeatures Data
yndarray shape nsamples or nsamples ntargets Target Will be cast to X's dtype
if necessary
checkinput boolean defaultTrue Allow to bypass several input checking Don't use
this parameter unless you know what you do

Notes

Coordinate descent is an algorithm that considers each column of data at a time hence it will automatically
convert the X input as a Fortrancontiguous numpy array if necessary
To avoid memory reallocation it is advised to allocate the initial data in memory directly using that format

getparams selfdeepTrue
Get parameters for this estimator

Parameters

deep boolean optional If True will return the parameters for this estimator and contained
subobjects that are estimators

Returns

params mapping of string to any Parameter names mapped to their values

Read more in the User Guide

Parameters

Xarraylike shape nsamples nfeatures Training data Pass directly as Fortran

contiguous data to avoid unnecessary memory duplication If yis monooutput then X

can be sparse

yndarray shape nsamples or nsamples noutputs Target values

l1ratio float optional float between 0 and 1 passed to elastic net scaling between l1 and

l2 penalties l1ratio1 corresponds to the Lasso

eps float Length of the path eps1e3 means that alphamin alphamax

1e3

nalphas int optional Number of alphas along the regularization path

alphas ndarray optional List of alphas where to compute the models If None alphas are

set automatically

precompute True False ‘auto’ arraylike Whether to use a precomputed Gram matrix

to speed up calculations If set to auto let us decide The Gram matrix can also be

passed as argument

Xyarraylike optional Xy npdotXT y that can be precomputed It is useful only

when the Gram matrix is precomputed

copyX boolean optional default True If True X will be copied else it may be over

written

coefinit array shape nfeatures None The initial values of the coefficients

verbose bool or integer Amount of verbosity

returnniter bool whether to return the number of iterations or not

positive bool default False If set to True forces coefficients to be positive Only allowed

whenyndim 1

checkinput bool default True Skip input validation checks including the Gram matrix

when provided assuming there are handled by the caller when checkinputFalse

params kwargs keyword arguments passed to the coordinate descent solver

Returns

alphas array shape nalphas The alphas along the path where models are computed

coefs array shape nfeatures nalphas or noutputs nfeatures nalphas Coefficients

along the path

622sklearnlinearmodel Generalized Linear Models 1887

scikitlearn user guide Release 0213

dualgaps array shape nalphas The dual gaps at the end of the optimization for each alpha

niters arraylike shape nalphas The number of iterations taken by the coordinate descent optimizer to reach the specified tolerance for each alpha Is returned when returnniter is set to True

predictselfX

Predict using the linear model

Parameters

Xarraylike or sparse matrix shape nsamples nfeatures Samples

Returns

Carray shape nsamples Returns predicted values

scoreselfXysampleweightNone

Returns the coefficient of determination R2 of the prediction

The coefficient R2 is defined as $1 - \frac{u}{v}$ where u is the residual sum of squares $y_{true} - y_{pred}$

$2sum$ and v is the total sum of squares $y_{true} - y_{truemean}$ $2sum$ The best possible score is 10 and it can be negative because the model can be arbitrarily worse A constant model that always predicts the expected value of y disregarding the input features would get a R2 score of 00

Parameters

Xarraylike shape nsamples nfeatures Test samples For some estimators this may

be a precomputed kernel matrix instead shape nsamples nsamplesfitted where

nsamplesfitted is the number of samples used in the fitting for the estimator

yarraylike shape nsamples or nsamples noutputs True values for X

sampleweight arraylike shape nsamples optional Sample weights

Returns

score float R2 of selfpredictX wrt y

Notes

The R2 score used when calling score on a regressor will use multioutputuniformaverage

from version 023 to keep consistent with metricsr2score This will influence the score

method of all the multioutput regressors except for multioutputMultiOutputRegressor

To specify the default value manually and avoid the warning please either call metricsr2score

1888 Chapter 6 API (Application Programming Interface) Reference

scikitlearn user guide Release 0213
directly or make a custom scorer with metricsmakescorer the builtin scorer r2 uses
multioutputuniformaverage
setparams selfparams
Set the parameters of this estimator
The method works on simple estimators as well as on nested objects such as pipelines The latter have
parameters of the form componentparameter so that it's possible to update each component
of a nested object
Returns
self
sparsecoef
sparse representation of the fitted coef
Examples using sklearnlinearmodelLasso
•Compressive sensing tomography reconstruction with L1 prior Lasso
•Crossvalidation on diabetes Dataset Exercise
•Lasso on dense and sparse data

Lasso model fit with Least Angle Regression aka Lars
It is a Linear Model trained with an L1 prior as regularizer
The optimization objective for Lasso is
$$\frac{1}{2} \|y - Xw\|_2^2 + \alpha \|w\|_1$$

Read more in the User Guide
Parameters
alpha float Constant that multiplies the penalty term Defaults to 10 alpha 0 is equiv
alent to an ordinary least square solved by LinearRegression For numerical reasons
usingalpha 0 with the LassoLars object is not advised and you should prefer the Lin
earRegression object
fitintercept boolean whether to calculate the intercept for this model If set to false no
intercept will be used in calculations eg data is expected to be already centered
verbose boolean or integer optional Sets the verbosity amount
normalize boolean optional default True This parameter is ignored when fitintercept
is set to False If True the regressors X will be normalized before regression by sub
tracting the mean and dividing by the l2norm If you wish to standardize please use
622sklearnlinearmodel Generalized Linear Models 1889

scikitlearn user guide Release 0213

sklearn.preprocessing.StandardScaler before calling fit on an estimator
with_normalize=False

precompute True False 'auto' arraylike Whether to use a precomputed Gram matrix to speed up calculations If set to auto let us decide The Gram matrix can also be passed as argument

max_iter integer optional Maximum number of iterations to perform

eps float optional The machineprecision regularization in the computation of the Cholesky diagonal factors Increase this for very illconditioned systems Unlike the tol parameter in some iterative optimizationbased algorithms this parameter does not control the tolerance of the optimization

copy_X boolean optional default True If True X will be copied else it may be overwritten

fit_path boolean If True the full path is stored in the coef_path attribute If you compute the solution for a large problem or many targets setting fit_path to False will lead to a speedup especially with a small alpha

positive boolean default False Restrict coefficients to be ≥ 0 Be aware that you might want to remove fit_intercept which is set True by default Under the positive restriction the model coefficients will not converge to the ordinaryleast squares solution for small values of alpha Only coefficients up to the smallest alpha value α_{min} when fit_path=True reached by the stepwise LarsLasso algorithm are typically in congruence with the solution of the coordinate descent Lasso estimator

Attributes

alphas array shape n_targets list of n_targets such arrays Maximum of covariances in absolute value at each iteration n_alphas is either max_iter n_features or the number of nodes in the path with correlation greater than alpha whichever is smaller
active_list_length n_alphas list of n_targets such lists Indices of active variables at the end of the path

coef_path array shape n_features n_alphas 1 or list If a list is passed it's expected to be one of n_targets such arrays The varying values of the coefficients along the path It is not present if the fit_path parameter is False

coef array shape n_features or n_targets n_features Parameter vector w in the formula
tion formula

intercept float array shape n_targets Independent term in decision function

n_iter arraylike or int The number of iterations taken by lars_path to find the grid of alphas for each target

6229sklearnlinearmodel LogisticRegression

classsklearnlinearmodel LogisticRegression penalty'12' dualFalse tol00001

C10 fitinterceptTrue inter

ceptscaling1 classweightNone

randomstateNone solver'warn'

maxiter100 multiclass'warn' ver

bose0 warmstartFalse njobsNone

l1ratioNone

Logistic Regression aka logit MaxEnt classifier

In the multiclass case the training algorithm uses the onevsrest OvR scheme if the 'multiclass' option is

set to 'ovr' and uses the crossentropy loss if the 'multiclass' option is set to 'multinomial' Currently the

'multinomial' option is supported only by the 'lbfgs' 'sag' 'saga' and 'newtoncg' solvers

This class implements regularized logistic regression using the 'liblinear' library 'newtoncg' 'sag' 'saga' and

'lbfgs' solvers Note that regularization is applied by default It can handle both dense and sparse input Use

Cordered arrays or CSR (Compressed Sparse Row) matrices containing 64bit floats for optimal performance any other input format will

be converted and copied

The 'newtoncg' 'sag' and 'lbfgs' solvers support only L2 regularization with primal formulation or no reg

ularization The 'liblinear' solver supports both L1 and L2 regularization with a dual formulation only for the

L2 penalty The ElasticNet regularization is only supported by the 'saga' solver

Read more in the User Guide

Parameters

penalty str 'l1' 'l2' 'elasticnet' or 'none' optional default'l2' Used to specify the norm

used in the penalization The 'newtoncg' 'sag' and 'lbfgs' solvers support only l2 penal

ties 'elasticnet' is only supported by the 'saga' solver If 'none' not supported by the

liblinear solver no regularization is applied

New in version 019 l1 penalty with SAGA solver allowing 'multinomial' L1

dual bool optional defaultFalse Dual or primal formulation Dual formulation is only

implemented for l2 penalty with liblinear solver Prefer dualFalse when nsamples

nfeatures

tolfloat optional default1e4 Tolerance for stopping criteria

Cfloat optional default10 Inverse of regularization strength must be a positive float Like

in support vector machines smaller values specify stronger regularization

fitintercept bool optional defaultTrue Specifies if a constant aka bias or intercept

should be added to the decision function

interceptscaling float optional default1 Useful only when the solver 'liblinear' is used

and selffitintercept is set to True In this case x becomes x selfinterceptscaling

ie a "synthetic" feature with constant value equal to interceptscaling is ap

pended to the instance vector The intercept becomes interceptscaling

syntheticfeatureweight

Note the synthetic feature weight is subject to l1l2 regularization as all other features To

lessen the effect of regularization on synthetic feature weight and therefore on the intercept

interceptscaling has to be increased

classweight dict or 'balanced' optional defaultNone Weights associated with classes in

the formclasslabel weight If not given all classes are supposed to have

weight one

1896 Chapter 6 API (Application Programming Interface) Reference

scikitlearn user guide Release 0213

The “balanced” mode uses the values of y to automatically adjust weights inversely proportional to class frequencies in the input data as $n_{\text{samples}} / n_{\text{classes}}$ n_{p} $n_{\text{bincounty}}$

Note that these weights will be multiplied with sampleweight passed through the fit method if sampleweight is specified

New in version 017 classweight ‘balanced’

randomstate int RandomState instance or None optional default None The seed of the pseudo random number generator to use when shuffling the data If int randomstate is the seed used by the random number generator If RandomState instance randomstate is the random number generator If None the random number generator is the RandomState instance used by nprandom Used when solver ‘sag’ or ‘liblinear’

solver str ‘newtoncg’ ‘lbfgs’ ‘liblinear’ ‘sag’ ‘saga’ optional default ‘liblinear’ Algorithm to use in the optimization problem

- For small datasets ‘liblinear’ is a good choice whereas ‘sag’ and ‘saga’ are faster for large ones

- For multiclass problems only ‘newtoncg’ ‘sag’ ‘saga’ and ‘lbfgs’ handle multinomial loss ‘liblinear’ is limited to one versus rest schemes

- ‘newtoncg’ ‘lbfgs’ ‘sag’ and ‘saga’ handle L2 or no penalty

- ‘liblinear’ and ‘saga’ also handle L1 penalty

- ‘saga’ also supports ‘elasticnet’ penalty

- ‘liblinear’ does not handle no penalty

Note that ‘sag’ and ‘saga’ fast convergence is only guaranteed on features with approximately the same scale You can preprocess the data with a scaler from sklearn.preprocessing

New in version 017 Stochastic Average Gradient descent solver

New in version 019 SAGA solver

Changed in version 020 Default will change from ‘liblinear’ to ‘lbfgs’ in 022

maxiter int optional default 100 Maximum number of iterations taken for the solvers to converge

multiclass str ‘ovr’ ‘multinomial’ ‘auto’ optional default ‘ovr’ If the option chosen is ‘ovr’ then a binary problem is fit for each label For ‘multinomial’ the loss minimised is the multinomial loss fit across the entire probability distribution even when the data is binary ‘multinomial’ is unavailable when solver ‘liblinear’ ‘auto’ selects ‘ovr’ if the data is binary or if solver ‘liblinear’ and otherwise selects ‘multinomial’

New in version 018 Stochastic Average Gradient descent solver for ‘multinomial’ case

Changed in version 020 Default will change from ‘ovr’ to ‘auto’ in 022

verbose int optional default 0 For the liblinear and lbfgs solvers set verbose to any positive number for verbosity

warmstart bool optional default False When set to True reuse the solution of the previous call to fit as initialization otherwise just erase the previous solution Useless for liblinear solver See the Glossary

New in version 017 warmstart to support lbfgs newtoncg sagsaga solvers

njobs int or None optional default None Number of CPU cores used when parallelizing over classes if multiclass ‘ovr’ This parameter is ignored when the solver is set to

622sklearnlinear model Generalized Linear Models 1897

scikitlearn user guide Release 0213

‘liblinear’ regardless of whether ‘multiclass’ is specified or not None means 1 unless in
ajoblibparallelbackend context1means using all processors See Glossary
for more details

l1ratio float or None optional defaultNone The ElasticNet mixing parameter with
0 l1ratio 1 Only used if penaltyelasticnet Setting
l1ratio0 is equivalent to using penaltyl2 while setting l1ratio1 is
equivalent to using penaltyl1 For0 l1ratio 1 the penalty is a combi
nation of L1 and L2

Attributes

classes array shape nclasses A list of class labels known to the classifier
coef array shape 1 nfeatures or nclasses nfeatures Coefficient of the features in the
decision function

coef is of shape 1 nfeatures when the given problem is binary In particular when
multiclassmultinomial coef corresponds to outcome 1 True and coef
corresponds to outcome 0 False

intercept array shape 1 or nclasses Intercept aka bias added to the decision func
tion

l1fitintercept is set to False the intercept is set to zero intercept
is of shape 1 when the given problem is binary In particular when
multiclassmultinomial intercept corresponds to outcome 1 True and
intercept corresponds to outcome 0 False

niter array shape nclasses or 1 Actual number of iterations for all classes If binary
or multinomial it returns only 1 element For liblinear solver only the maximum number
of iteration across all classes is given

Changed in version 020 In SciPy 100 the number of lbfgs iterations may exceed
maxiter niter will now report at most maxiter

See also
SGDClassifier incrementally trained logistic regression when given the parameter losslog
LogisticRegressionCV Logistic regression with builtin cross validation

Notes
The underlying C implementation uses a random number generator to select features when fitting the model
It is thus not uncommon to have slightly different results for the same input data If that happens try with a
smaller tol parameter

Predict output may not match that of standalone liblinear in certain cases See differences from liblinear in the
narrative documentation

Methods

decision_function(self, X) Predict confidence scores for samples

densify(self) Convert coefficient matrix to dense array format

fit(self, X, y, sample_weight) Fit the model according to the given training data

get_params(self, deep=True) Get parameters for this estimator

predict(self, X) Predict class labels for samples in X

predict_log_proba(self, X) Log of probability estimates

predict_proba(self, X) Probability estimates

score(self, X, y, sample_weight) Returns the mean accuracy on the given test data and labels

set_params(self, **params) Set the parameters of this estimator

sparsify(self) Convert coefficient matrix to sparse format

init(self, penalty='l2', dual=False, tol=0.0001, C=1.0, fit_intercept=True, intercept_scaling=1, class_weight=None, random_state=None, solver='warn', max_iter=100, multi_class='warn', verbose=0, warm_start=False, n_jobs=None, l1_ratio=None)

decision_function(self, X)

Predict confidence scores for samples

The confidence score for a sample is the signed distance of that sample to the hyperplane

Parameters

X: array-like or sparse matrix shape (n_samples, n_features) Samples

Returns

array shape (n_samples, n_classes - 1) Confidence scores per sample class combination In the binary case confidence score for self.classes_[1] where 0 means this class would be predicted

622sklearn.linear_model Generalized Linear Models 1899

scikitlearn user guide Release 0213

densifyself

Convert coefficient matrix to dense array format

Converts the coef member back to a numpyndarray This is the default format of coef and is required for fitting so calling this method is only required on models that have previously been sparsified otherwise it is a noop

Returns

self estimator

fitselfXysampleweightNone

Fit the model according to the given training data

Parameters

Xarraylike sparse matrix shape nsamples nfeatures Training vector where nsamples is the number of samples and nfeatures is the number of features

yarraylike shape nsamples Target vector relative to X

sampleweight arraylike shape nsamples optional Array of weights that are assigned to individual samples If not provided then each sample is given unit weight

New in version 017 sampleweight support to LogisticRegression

Returns

self object

Notes

The SAGA solver supports both float64 and float32 bit arrays

getparams selfdeepTrue

Get parameters for this estimator

Parameters

deep boolean optional If True will return the parameters for this estimator and contained subobjects that are estimators

Returns

params mapping of string to any Parameter names mapped to their values

predictselfX

Predict class labels for samples in X

Parameters

Xarraylike or sparse matrix shape nsamples nfeatures Samples

Returns

Carray shape nsamples Predicted class label per sample

predictlogproba selfX

Log of probability estimates

The returned estimates for all classes are ordered by the label of classes

Parameters

Xarraylike shape nsamples nfeatures

1900 Chapter 6 API (Application Programming Interface) Reference

scikitlearn user guide Release 0213

Returns

Tarraylike shape nsamples nclasses Returns the logprobability of the sample for each class in the model where classes are ordered as they are in selfclasses

predictproba selfX

Probability estimates

The returned estimates for all classes are ordered by the label of classes

For a multiclass problem if multiclass is set to be “multinomial” the softmax function is used to find the predicted probability of each class Else use a onevsrest approach ie calculate the probability of each class assuming it to be positive using the logistic function and normalize these values across all the classes

Parameters

Xarraylike shape nsamples nfeatures

Returns

Tarraylike shape nsamples nclasses Returns the probability of the sample for each class in the model where classes are ordered as they are in selfclasses

scoreselfXysampleweightNone

Returns the mean accuracy on the given test data and labels

In multilabel classification this is the subset accuracy which is a harsh metric since you require for each sample that each label set be correctly predicted

Parameters

Xarraylike shape nsamples nfeatures Test samples

yarraylike shape nsamples or nsamples noutputs True labels for X

sampleweight arraylike shape nsamples optional Sample weights

Returns

score float Mean accuracy of selfpredictX wrt y

setparams selfparams

Set the parameters of this estimator

The method works on simple estimators as well as on nested objects such as pipelines The latter have parameters of the form componentparameter so that it’s possible to update each component of a nested object

Returns

self

sparsify self

Convert coefficient matrix to sparse format

Converts the coef member to a scipysparse matrix which for L1regularized models can be much more memory and storageefficient than the usual numpyndarray representation

Theintercept member is not converted

Returns

self estimator

622sklearnlinearmodel Generalized Linear Models 1901

Notes

For nonsparse models ie when there are not many zeros in coef this may actually increase memory usage so use this method with care A rule of thumb is that the number of zero elements which can be computed with coef_0sum must be more than 50 for this to provide significant benefits After calling this method further fitting with the partialfit method if any will not work until you call densify

Examples using sklearnlinearmodelLogisticRegression

- Compact estimator representations
- Comparison of Calibration of Classifiers
- Probability Calibration curves
- Plot classification probability
- Column Transformer with Mixed Types
- Plot class probabilities calculated by the VotingClassifier
- Feature transformations with ensembles of trees
- Digits Classification Exercise
- Regularization path of L1 Logistic Regression
- Logistic function
- Logistic Regression 3class Classifier
- Comparing various online solvers
- MNIST classification using multinomial logistic L1
- Plot multinomial and OnevsRest Logistic Regression
- L1 Penalty and Sparsity in Logistic Regression
- Multiclass sparse logisitic regression on newgroups20
- Classifier Chain
- Restricted Boltzmann Machine features for digit classification
- Feature discretization

tion'cyclic'

Multitask Lasso model trained with L1L2 mixednorm as regularizer

The optimization objective for Lasso is

$$\frac{1}{2} \|Y - XW\|_2^2 + \alpha \|W\|_1$$

Where

scikitlearn user guide Release 0213

W21 sumi sqrtsumj wij2

ie the sum of norm of each row

Read more in the User Guide

Parameters

alpha float optional Constant that multiplies the L1L2 term Defaults to 10

fitintercept boolean whether to calculate the intercept for this model If set to false no

intercept will be used in calculations eg data is expected to be already centered

normalize boolean optional default False This parameter is ignored when

fitintercept is set to False If True the regressors X will be normalized be

fore regression by subtracting the mean and dividing by the l2norm If you wish to

standardize please use sklearnpreprocessingStandardScaler before

callingfit on an estimator with normalizeFalse

copyX boolean optional default True If True X will be copied else it may be overwritten

maxiter int optional The maximum number of iterations

tolfloat optional The tolerance for the optimization if the updates are smaller than tol the

optimization code checks the dual gap for optimality and continues until it is smaller than

tol

warmstart bool optional When set to True reuse the solution of the previous call to fit as

initialization otherwise just erase the previous solution See the Glossary

randomstate int RandomState instance or None optional default None The seed of the

pseudo random number generator that selects a random feature to update If int ran

domstate is the seed used by the random number generator If RandomState instance

randomstate is the random number generator If None the random number generator is

the RandomState instance used by nprandom Used when selection 'random'

selection str default 'cyclic' If set to 'random' a random coefficient is updated every iteration

rather than looping over features sequentially by default This setting to 'random' often

leads to significantly faster convergence especially when tol is higher than 1e4

Attributes

coef array shape ntasks nfeatures Parameter vector W in the cost function formula

Note thatcoef stores the transpose of WW^T

intercept array shape ntasks independent term in decision function

niter int number of iterations run by the coordinate descent solver to reach the specified

tolerance

See also

Notes
For an example see exampleslinearmodelplotlassocoordinatedescentpathpy
predictselfX

Predict using the linear model

Parameters
Xarraylike or sparse matrix shape nsamples nfeatures Samples
Returns

Carray shape nsamples Returns predicted values
scoreselfXysampleweightNone
Returns the coefficient of determination R2 of the prediction
The coefficient R2 is defined as $1 - \frac{u}{v}$ where u is the residual sum of squares $y_{true} - y_{pred}$
 $2sum$ and v is the total sum of squares $y_{true} - y_{truemean}$ $2sum$ The best possible score
is 10 and it can be negative because the model can be arbitrarily worse A constant model that always
predicts the expected value of y disregarding the input features would get a R2 score of 00

Parameters
Xarraylike shape nsamples nfeatures Test samples For some estimators this may
be a precomputed kernel matrix instead shape nsamples nsamplesfitted where
nsamplesfitted is the number of samples used in the fitting for the estimator
yarraylike shape nsamples or nsamples noutputs True values for X
1906 Chapter 6 API (Application Programming Interface) Reference

scikitlearn user guide Release 0213

sampleweight arraylike shape nsamples optional Sample weights

Returns

score float R2 of selfpredictX wrt y

Notes

The R2 score used when calling score on a regressor will use multioutputuniformaverage from version 023 to keep consistent with metricsr2score This will influence the score method of all the multioutput regressors except for multioutputMultiOutputRegressor

To specify the default value manually and avoid the warning please either call metricsr2score directly or make a custom scorer with metricsmakescorer the builtin scorer r2 uses multioutputuniformaverage

setparams selfparams

Set the parameters of this estimator

The method works on simple estimators as well as on nested objects such as pipelines The latter have parameters of the form componentparameter so that it's possible to update each component of a nested object

Returns

self

ageFalse

Passive Aggressive Classifier

Read more in the User Guide

Parameters

Cfloat Maximum step size regularization Defaults to 10

fitintercept bool defaultFalse Whether the intercept should be estimated or not If False the data is assumed to be already centered

maxiter int optional default1000 The maximum number of passes over the training data

aka epochs It only impacts the behavior in the fit method and not the partialfit

New in version 019

tolfloat or None optional default1e3 The stopping criterion If it is not None the iterations will stop when loss previousloss tol

New in version 019

earlystopping bool defaultFalse Whether to use early stopping to terminate training when validation score is not improving If set to True it will automatically set aside a stratified fraction of training data as validation and terminate training when validation score is not improving by at least tol for niternochange consecutive epochs

New in version 020

validationfraction float default01 The proportion of training data to set aside as validation set for early stopping Must be between 0 and 1 Only used if earlystopping is True

New in version 020

622sklearnlinearmodel Generalized Linear Models 1915

scikitlearn user guide Release 0213

niternochange int default5 Number of iterations with no improvement to wait before early stopping

New in version 020

shuffle bool defaultTrue Whether or not the training data should be shuffled after each epoch

verbose integer optional The verbosity level

loss string optional The loss function to be used hinge equivalent to PAI in the reference paper squaredhinge equivalent to PAII in the reference paper

njobs int or None optional defaultNone The number of CPUs to use to do the OV A One Versus All for multiclass problems computation None means 1 unless in a joblib parallelbackend context1means using all processors See Glossary for more details

randomstate int RandomState instance or None optional defaultNone The seed of the pseudo random number generator to use when shuffling the data If int randomstate is the seed used by the random number generator If RandomState instance randomstate is the random number generator If None the random number generator is the RandomState instance used by nprandom

warmstart bool optional When set to True reuse the solution of the previous call to fit as initialization otherwise just erase the previous solution See the Glossary Repeatedly calling fit or partialfit when warmstart is True can result in a different solution than when calling fit a single time because of the way the data is shuffled

classweight dict classlabel weight or “balanced” or None optional Preset for the classweight fit parameter

Weights associated with classes If not given all classes are supposed to have weight one The “balanced” mode uses the values of y to automatically adjust weights inversely proportional to class frequencies in the input data as nsamples nclasses np

bincounty

New in version 017 parameter classweight to automatically weight samples

average bool or int optional When set to True computes the averaged SGD weights and stores the result in the coef attribute If set to an int greater than 1 averaging will begin once the total number of samples seen reaches average So average10 will begin averaging after seeing 10 samples

New in version 019 parameter average to use weights averaging in SGD

Attributes

coef array shape 1 nfeatures if nclasses 2 else nclasses nfeatures Weights assigned to the features

intercept array shape 1 if nclasses 2 else nclasses Constants in decision function

niter int The actual number of iterations to reach the stopping criterion For multiclass fits it is the maximum over every binary fit

Methods

decision_function(self, X) Predict confidence scores for samples
densify(self) Convert coefficient matrix to dense array format
fit(self, X, y, coef_init=None, intercept_init=None) Fit linear model with Passive Aggressive algorithm
get_params(self, deep=True) Get parameters for this estimator
partial_fit(self, X, y, classes=None) Fit linear model with Passive Aggressive algorithm
predict(self, X) Predict class labels for samples in X
score(self, X, y, sample_weight=None) Returns the mean accuracy on the given test data and labels
set_params(self, **kwargs) Set parameters for this estimator
sparsify(self) Convert coefficient matrix to sparse format
init(self, C=10, fit_intercept=True, max_iter=1000, tol=0.001, early_stopping=False, validation_fraction=0.1, niternochange=5, shuffle=True, verbose=0, loss='hinge', n_jobs=None, random_state=None, warm_start=False, class_weight=None, average=False)
decision_function(self, X) Predict confidence scores for samples
The confidence score for a sample is the signed distance of that sample to the hyperplane
Parameters
X: array-like or sparse matrix shape (n_samples, n_features) Samples
622sklearn.linear_model Generalized Linear Models 1917

scikitlearn user guide Release 0213

Returns

array shapensamples if nclasses > 2 else nsamples nclasses Confidence scores per sample class combination In the binary case confidence score for selfclasses1 where 0 means this class would be predicted

densifyself

Convert coefficient matrix to dense array format

Converts the coef member back to a numpyndarray This is the default format of coef and is required for fitting so calling this method is only required on models that have previously been sparsified otherwise it is a noop

Returns

self estimator

fitselfXycoefinitNone interceptinitNone

Fit linear model with Passive Aggressive algorithm

Parameters

Xarraylike sparse matrix shape nsamples nfeatures Training data

ynumpy array of shape nsamples Target values

coefinit array shape nclassesnfeatures The initial coefficients to warmstart the optimization

interceptinit array shape nclasses The initial intercept to warmstart the optimization

Returns

self returns an instance of self

getparams selfdeepTrue

Get parameters for this estimator

Parameters

deep boolean optional If True will return the parameters for this estimator and contained subobjects that are estimators

Returns

params mapping of string to any Parameter names mapped to their values

partialfit selfXyclassesNone

Fit linear model with Passive Aggressive algorithm

Parameters

Xarraylike sparse matrix shape nsamples nfeatures Subset of the training data

ynumpy array of shape nsamples Subset of the target values

classes array shape nclasses Classes across all calls to partialfit Can be obtained by vianpuniqueyall where yall is the target vector of the entire dataset This

argument is required for the first call to partialfit and can be omitted in the subsequent calls Note that y doesn't need to contain all labels in classes

Returns

self returns an instance of self

1918 Chapter 6 API (Application Programming Interface) Reference

scikitlearn user guide Release 0213

predictselfX

Predict class labels for samples in X

Parameters

Xarraylike or sparse matrix shape nsamples nfeatures Samples

Returns

Carray shape nsamples Predicted class label per sample

scoreselfXysampleweightNone

Returns the mean accuracy on the given test data and labels

In multilabel classification this is the subset accuracy which is a harsh metric since you require for each sample that each label set be correctly predicted

Parameters

Xarraylike shape nsamples nfeatures Test samples

yarraylike shape nsamples or nsamples noutputs True labels for X

sampleweight arraylike shape nsamples optional Sample weights

Returns

score float Mean accuracy of selfpredictX wrt y

sparsify self

Convert coefficient matrix to sparse format

Converts the coef member to a scipysparse matrix which for L1regularized models can be much more memory and storageefficient than the usual numpyndarray representation

Theintercept member is not converted

Returns

self estimator

Notes

For nonsparse models ie when there are not many zeros in coef this may actually increase memory usage so use this method with care A rule of thumb is that the number of zero elements which can be computed with coef_0sum must be more than 50 for this to provide significant benefits

After calling this method further fitting with the partialfit method if any will not work until you call

densify

Parameters

Cfloat Maximum step size regularization Defaults to 10

fitintercept bool Whether the intercept should be estimated or not If False the data is assumed to be already centered Defaults to True

maxiter int optional default=1000 The maximum number of passes over the training data aka epochs It only impacts the behavior in the fit method and not the partialfit

New in version 0.19

tol float or None optional default=1e-3 The stopping criterion If it is not None the iterations will stop when loss - previousloss < tol

New in version 0.19

earlystopping bool default=False Whether to use early stopping to terminate training when validation score is not improving If set to True it will automatically set aside a fraction of training data as validation and terminate training when validation score is not improving by at least tol for niternochange consecutive epochs

New in version 0.20

validationfraction float default=0.1 The proportion of training data to set aside as validation set for early stopping Must be between 0 and 1 Only used if earlystopping is True

New in version 0.20

niternochange int default=5 Number of iterations with no improvement to wait before early stopping

New in version 0.20

shuffle bool default=True Whether or not the training data should be shuffled after each epoch

verbose integer optional The verbosity level

loss string optional The loss function to be used epsiloninsensitive equivalent to PAI in the reference paper squaredepsiloninsensitive equivalent to PAII in the reference paper

epsilon float If the difference between the current prediction and the correct label is below this threshold the model is not updated

randomstate int RandomState instance or None optional default=None The seed of the pseudo random number generator to use when shuffling the data If int randomstate is the seed used by the random number generator If RandomState instance randomstate is

1920 Chapter 6 API (Application Programming Interface) Reference

scikitlearn user guide Release 0213

the random number generator If None the random number generator is the RandomState instance used by nprandom

warmstart bool optional When set to True reuse the solution of the previous call to fit as initialization otherwise just erase the previous solution See the Glossary

Repeatedly calling fit or partialfit when warmstart is True can result in a different solution than when calling fit a single time because of the way the data is shuffled

average bool or int optional When set to True computes the averaged SGD weights and stores the result in the coef attribute If set to an int greater than 1 averaging will begin once the total number of samples seen reaches average So average10 will begin averaging after seeing 10 samples

New in version 019 parameter average to use weights averaging in SGD

Attributes

coef array shape 1 nfeatures if nclasses 2 else nclasses nfeatures Weights assigned to the features

intercept array shape 1 if nclasses 2 else nclasses Constants in decision function

niter int The actual number of iterations to reach the stopping criterion

Fit linear model with Passive Aggressive algorithm

Parameters

Xarraylike sparse matrix shape nsamples nfeatures Training data

ynumpy array of shape nsamples Target values

coefinit array shape nfeatures The initial coefficients to warmstart the optimization

interceptinit array shape 1 The initial intercept to warmstart the optimization

Returns

self returns an instance of self

getparams selfdeepTrue

Get parameters for this estimator

Parameters

deep boolean optional If True will return the parameters for this estimator and contained subobjects that are estimators

Returns

params mapping of string to any Parameter names mapped to their values

partialfit selfXy

Fit linear model with Passive Aggressive algorithm

Parameters

1922 Chapter 6 API (Application Programming Interface) Reference

scikitlearn user guide Release 0213

Xarraylike sparse matrix shape nsamples nfeatures Subset of training data

ynumpy array of shape nsamples Subset of target values

Returns

self returns an instance of self

predictselfX

Predict using the linear model

Parameters

Xarraylike sparse matrix shape nsamples nfeatures

Returns

array shape nsamples Predicted target values per element in X

scoreselfXysampleweightNone

Returns the coefficient of determination R2 of the prediction

The coefficient R2 is defined as $1 - \frac{u}{v}$ where u is the residual sum of squares $y_{true} - y_{pred}$

$2sum$ and v is the total sum of squares $y_{true} - y_{truemean}$ $2sum$ The best possible score

is 10 and it can be negative because the model can be arbitrarily worse A constant model that always

predicts the expected value of y disregarding the input features would get a R2 score of 00

Parameters

Xarraylike shape nsamples nfeatures Test samples For some estimators this may

be a precomputed kernel matrix instead shape nsamples nsamplesfitted where

nsamplesfitted is the number of samples used in the fitting for the estimator

yarraylike shape nsamples or nsamples noutputs True values for X

sampleweight arraylike shape nsamples optional Sample weights

Returns

score float R2 of selfpredictX wrt y

Notes

The R2 score used when calling score on a regressor will use multioutputuniformaverage

from version 023 to keep consistent with metricsr2score This will influence the score

method of all the multioutput regressors except for multioutputMultiOutputRegressor

To specify the default value manually and avoid the warning please either call metricsr2score

directly or make a custom scorer with metricsmakescorer the builtin scorer r2 uses

multioutputuniformaverage

sparsify self

Convert coefficient matrix to sparse format

Converts the coef member to a scipysparse matrix which for L1regularized models can be much more

memory and storageefficient than the usual numpyndarray representation

Theintercept member is not converted

Returns

self estimator

622sklearnlinearmodel Generalized Linear Models 1923

Notes

For nonsparse models ie when there are not many zeros in coef this may actually increase memory usage so use this method with care A rule of thumb is that the number of zero elements which can be computed with coef_0sum must be more than 50 for this to provide significant benefits After calling this method further fitting with the partialfit method if any will not work until you call densify

RANSAC RANdom SAmple Consensus algorithm

RANSAC is an iterative algorithm for the robust estimation of parameters from a subset of inliers from the complete data set More information can be found in the general documentation of linear models

1928 Chapter 6 API (Application Programming Interface) Reference

scikitlearn user guide Release 0213

A detailed description of the algorithm can be found in the documentation of the linearmodel subpackage
Read more in the User Guide

Parameters

baseestimator object optional Base estimator object which implements the following methods

- fitX y Fit model to given training data and target values
- scoreX y Returns the mean accuracy on the given test data which is used for the stop criterion defined by stopscore Additionally the score is used to decide which of two equally large consensus sets is chosen as the better one
- predictX Returns predicted values using the linear model which is used to compute residual error using loss function

If baseestimator is None then baseestimatorsklearnlinearmodel

LinearRegression is used for target values of dtype float

Note that the current implementation only supports regression estimators

minsamples int 1 or float 0 1 optional Minimum number of samples chosen

randomly from original data Treated as an absolute number of samples for

minsamples 1 treated as a relative number ceilminsamples X

shape0 forminsamples 1 This is typically chosen as the minimal number

of samples necessary to estimate the given baseestimator By default a sklearn

linearmodelLinearRegression estimator is assumed and minsamples is

chosen asXshape1 1

residualthreshold float optional Maximum residual for a data sample to be classified as an inlier By default the threshold is chosen as the MAD median absolute deviation of the target values y

isdatavalid callable optional This function is called with the randomly selected data before the model is fitted to it isdatavalidX y If its return value is False the current randomly chosen subsample is skipped

ismodelvalid callable optional This function is called with the estimated model and the randomly selected data ismodelvalidmodel X y If its return value is False the current randomly chosen subsample is skipped Rejecting samples with this function is computationally costlier than with isdatavalid ismodelvalid should therefore only be used if the estimated model is needed for making the rejection decision
maxtrials int optional Maximum number of iterations for random sample selection
maxskips int optional Maximum number of iterations that can be skipped due to finding zero inliers or invalid data defined by isdatavalid or invalid models defined by ismodelvalid

New in version 019

stopninliers int optional Stop iteration if at least this number of inliers are found

stopscore float optional Stop iteration if score is greater equal than this threshold

stopprobability float in range 0 1 optional RANSAC iteration stops if at least one outlier free set of the training data is sampled in RANSAC This requires to generate at least N samples iterations

N log1 probability log1 e m

622sklearnlinearmodel Generalized Linear Models 1929

scikitlearn user guide Release 0213

where the probability confidence is typically set to high value such as 0.99 the default
and e is the current fraction of inliers wrt the total number of samples
loss string callable optional default "absoluteloss" String inputs "absoluteloss" and
"squaredloss" are supported which find the absolute loss and squared loss per sample re
spectively
If `floss` is a callable then it should be a function that takes two arrays as inputs the true
and predicted value and returns a 1D array with the i th value of the array corresponding to
the loss on X_i
If the loss on a sample is greater than the `residualthreshold` then this sample is
classified as an outlier
`randomstate` int RandomState instance or None optional default None The generator used
to initialize the centers If int `randomstate` is the seed used by the random number gener
ator If RandomState instance `randomstate` is the random number generator If None the
random number generator is the RandomState instance used by `nprandom`
Attributes
`estimator` object Best fitted model copy of the `baseestimator` object
`ntrials` int Number of random selection trials until one of the stop criteria is met It is
always `maxtrials`
`inliermask` bool array of shape `nsamples` Boolean mask of inliers classified as True
`nskipsnotinliers` int Number of iterations skipped due to finding zero inliers
New in version 0.19
`nskipsinvaliddata` int Number of iterations skipped due to invalid data defined by
`isdatavalid`
New in version 0.19
`nskipsinvalidmodel` int Number of iterations skipped due to an invalid model defined by
`ismodelvalid`
New in version 0.19

Fit estimator using RANSAC algorithm

Parameters

Xarraylike or sparse matrix shape nsamples nfeatures Training data

yarraylike shape nsamples or nsamples ntargets Target values

sampleweight arraylike shape nsamples Individual weights for each sample raises error if sampleweight is passed and baseestimator fit method does not support it

Raises

ValueError If no valid consensus set could be found This occurs if isdatavalid and

ismodelvalid return False for all maxtrials randomly chosen subsamples

getparams selfdeepTrue

Get parameters for this estimator

Parameters

deep boolean optional If True will return the parameters for this estimator and contained

subobjects that are estimators

Returns

params mapping of string to any Parameter names mapped to their values

predictselfX

Predict using the estimated model

This is a wrapper for estimatorpredictX

Parameters

Xnumpy array of shape nsamples nfeatures

Returns

yarray shape nsamples or nsamples ntargets Returns predicted values

scoreselfXy

Returns the score of the prediction

This is a wrapper for estimatorscoreX y

Parameters

Xnumpy array or sparse matrix of shape nsamples nfeatures Training data

622sklearnlinearmodel Generalized Linear Models 1931

scikitlearn user guide Release 0213

yarray shape nsamples or nsamples ntargets Target values

Returns

zfloat Score of the prediction

setparams selfparams

Set the parameters of this estimator

The method works on simple estimators as well as on nested objects such as pipelines The latter have parameters of the form componentparameter so that it's possible to update each component of a nested object

Returns

self

Examples using sklearnlinearmodelRANSACRegressor

randomstateNone

Linear least squares with l2 regularization

Minimizes the objective function

y Xw22 alpha w22

This model solves a regression model where the loss function is the linear least squares function and regularization is given by the l2norm Also known as Ridge Regression or Tikhonov regularization This estimator has builtin support for multivariate regression ie when y is a 2darray of shape nsamples ntargets

Read more in the User Guide

Parameters

alpha float arraylike shape ntargets Regularization strength must be a positive float

Regularization improves the conditioning of the problem and reduces the variance of the estimates Larger values specify stronger regularization Alpha corresponds to C1 in other

linear models such as LogisticRegression or LinearSVC If an array is passed penalties are

assumed to be specific to the targets Hence they must correspond in number

fitintercept boolean Whether to calculate the intercept for this model If set to false no

intercept will be used in calculations eg data is expected to be already centered

normalize boolean optional default False This parameter is ignored when

fitintercept is set to False If True the regressors X will be normalized be

fore regression by subtracting the mean and dividing by the l2norm If you wish to

standardize please use sklearnpreprocessingStandardScaler before

callingfit on an estimator with normalizeFalse

copyX boolean optional default True If True X will be copied else it may be overwritten

1932 Chapter 6 API (Application Programming Interface) Reference

scikitlearn user guide Release 0213

maxiter int optional Maximum number of iterations for conjugate gradient solver For 'sparsecg' and 'lsqr' solvers the default value is determined by scipysparselinalg For 'sag' solver the default value is 1000

tolfloat Precision of the solution

solver 'auto' 'svd' 'cholesky' 'lsqr' 'sparsecg' 'sag' 'saga' Solver to use in the computational routines

- 'auto' chooses the solver automatically based on the type of data
- 'svd' uses a Singular Value Decomposition of X to compute the Ridge coefficients More stable for singular matrices than 'cholesky'
- 'cholesky' uses the standard scipy.linalg.solve function to obtain a closedform solution
- 'sparsecg' uses the conjugate gradient solver as found in scipysparselinalg.cg As an iterative algorithm this solver is more appropriate than 'cholesky' for largescale data possibility to set tol andmaxiter
- 'lsqr' uses the dedicated regularized leastsquares routine scipysparselinalg.lsqr It is the fastest and uses an iterative procedure
- 'sag' uses a Stochastic Average Gradient descent and 'saga' uses its improved unbiased version named SAGA Both methods also use an iterative procedure and are often faster than other solvers when both nsamples and nfeatures are large Note that 'sag' and 'saga' fast convergence is only guaranteed on features with approximately the same scale You can preprocess the data with a scaler from sklearn.preprocessing

All last five solvers support both dense and sparse data However only 'sag' and 'sparsecg' supports sparse input when fitintercept is True

New in version 017 Stochastic Average Gradient descent solver

New in version 019 SAGA solver

randomstate int RandomState instance or None optional default None The seed of the pseudo random number generator to use when shuffling the data If int randomstate is the seed used by the random number generator If RandomState instance randomstate is the random number generator If None the random number generator is the RandomState instance used by np.random Used when solver 'sag'

New in version 017 randomstate to support Stochastic Average Gradient

Attributes

coef array shape nfeatures or ntargets nfeatures Weight vectors

intercept float array shape ntargets Independent term in decision function Set to 00

ifitintercept False

niter array or None shape ntargets Actual number of iterations for each target Avail

able only for sag and lsqr solvers Other solvers will return None

New in version 017

622sklearn.linear_model Generalized Linear Models 1933

scikitlearn user guide Release 0213

Examples

```
from sklearn.linear_model import Ridge
import numpy as np
nsamples, nfeatures = 10, 5
rng = np.random.RandomState(0)
y = rng.randn(nsamples)
X = rng.randn(nsamples, nfeatures)
clf = Ridge(alpha=10)
clf.fit(X, y)
Ridge(alpha=10, copy_X=True, fit_intercept=True, max_iter=None,
normalize=False, random_state=None, solver='auto', tol=0.001)
```

Methods

```
fit(self, X, y, sample_weight) Fit Ridge regression model
get_params(self, deep) Get parameters for this estimator
predict(self, X) Predict using the linear model
score(self, X, y, sample_weight) Returns the coefficient of determination R2 of the prediction
set_params(self, **params) Set the parameters of this estimator
init(self, alpha=10, fit_intercept=True, normalize=False, copy_X=True, max_iter=None,
tol=0.001, solver='auto', random_state=None)
fit(self, X, y, sample_weight=None)
```

Fit Ridge regression model

Parameters

Xarraylike sparse matrix shape (nsamples, nfeatures) Training data
yarraylike shape (nsamples, or nsamples, ntargets) Target values
sample_weight float or numpy array of shape (nsamples,) Individual weights for each sample
Returns

self returns an instance of self
get_params(self, deep=True)
Get parameters for this estimator
Parameters

deep boolean optional If True will return the parameters for this estimator and contained subobjects that are estimators
Returns

params mapping of string to any Parameter names mapped to their values
predict(self, X)
Predict using the linear model
Parameters

Xarraylike or sparse matrix shape (nsamples, nfeatures) Samples
1934 Chapter 6 API (Application Programming Interface) Reference

scikitlearn user guide Release 0213

Returns

Carray shape nsamples Returns predicted values

scoreselfXysampleweightNone

Returns the coefficient of determination R2 of the prediction

The coefficient R2 is defined as $1 - \frac{u}{v}$ where u is the residual sum of squares $y_{true} - y_{pred}$

2sum and v is the total sum of squares $y_{true} - y_{truemean}$ 2sum The best possible score

is 10 and it can be negative because the model can be arbitrarily worse A constant model that always

predicts the expected value of y disregarding the input features would get a R2 score of 00

Parameters

Xarraylike shape nsamples nfeatures Test samples For some estimators this may

be a precomputed kernel matrix instead shape nsamples nsamplesfitted where

nsamplesfitted is the number of samples used in the fitting for the estimator

yarraylike shape nsamples or nsamples noutputs True values for X

sampleweight arraylike shape nsamples optional Sample weights

Returns

score float R2 of selfpredictX wrt y

Notes

The R2 score used when calling score on a regressor will use multioutputuniformaverage

from version 023 to keep consistent with metricsr2score This will influence the score

method of all the multioutput regressors except for multioutputMultiOutputRegressor

To specify the default value manually and avoid the warning please either call metricsr2score

directly or make a custom scorer with metricsmakescorer the builtin scorer r2 uses

multioutputuniformaverage

setparams selfparams

Set the parameters of this estimator

The method works on simple estimators as well as on nested objects such as pipelines The latter have

parameters of the form componentparameter so that it's possible to update each component

of a nested object

Returns

self

Examples using sklearnlinearmodelRidge

•Compressive sensing tomography reconstruction with L1 prior Lasso

•Prediction Latency

•Plot Ridge coefficients as a function of the regularization

•Ordinary Least Squares and Ridge Regression Variance

•Plot Ridge coefficients as a function of the L2 regularization

•Polynomial interpolation

•HuberRegressor vs Ridge on dataset with strong outliers

Linear classifiers SVM (Support Vector Machine) logistic regression ao with SGD training

This estimator implements regularized linear models with stochastic gradient descent SGD learning the gra

dient of the loss is estimated each sample at a time and the model is updated along the way with a decreasing

strength schedule aka learning rate SGD allows minibatch onlineoutofcore learning see the partialfit

method For best results using the default learning rate schedule the data should have zero mean and unit

variance

This implementation works with data represented as dense or sparse arrays of floating point values for the

features The model it fits can be controlled with the loss parameter by default it fits a linear support vector

machine SVM (Support Vector Machine)

The regularizer is a penalty added to the loss function that shrinks model parameters towards the zero vector

using either the squared euclidean norm L2 or the absolute norm L1 or a combination of both Elastic Net If

the parameter update crosses the 00 value because of the regularizer the update is truncated to 00 to allow for

learning sparse models and achieve online feature selection

Read more in the User Guide

Parameters

loss str default 'hinge' The loss function to be used Defaults to 'hinge' which gives a linear

SVM (Support Vector Machine)

The possible options are 'hinge' 'log' 'modifiedhuber' 'squaredhinge' 'per

ceptron' or a regression loss 'squaredloss' 'huber' 'epsiloninsensitive' or

'squaredepsiloninsensitive'

622sklearnlinearmodel Generalized Linear Models 1939

scikitlearn user guide Release 0213

The 'log' loss gives logistic regression a probabilistic classifier 'modifiedhuber' is another smooth loss that brings tolerance to outliers as well as probability estimates 'squaredhinge' is like hinge but is quadratically penalized 'perceptron' is the linear loss used by the perceptron algorithm The other losses are designed for regression but can be useful in classification as well see SGDRegressor for a description

penalty str 'none' 'l2' 'l1' or 'elasticnet' The penalty aka regularization term to be used Defaults to 'l2' which is the standard regularizer for linear SVM (Support Vector Machine) models 'l1' and 'elasticnet' might bring sparsity to the model feature selection not achievable with 'l2'

alpha float Constant that multiplies the regularization term Defaults to 0.0001 Also used to compute learningrate when set to 'optimal'

l1ratio float The Elastic Net mixing parameter with 0 l1ratio 1 l1ratio0 corresponds to L2 penalty l1ratio1 to L1 Defaults to 0.15

fitintercept bool Whether the intercept should be estimated or not If False the data is assumed to be already centered Defaults to True

maxiter int optional default1000 The maximum number of passes over the training data aka epochs It only impacts the behavior in the fit method and not the partialfit

New in version 0.19

tol float or None optional default1e3 The stopping criterion If it is not None the iterations will stop when loss - bestloss > tol for niter no change consecutive epochs

New in version 0.19

shuffle bool optional Whether or not the training data should be shuffled after each epoch Defaults to True

verbose integer optional The verbosity level

epsilon float Epsilon in the epsilon insensitive loss functions only if loss is 'huber' 'epsilon insensitive' or 'squared epsilon insensitive' For 'huber' determines the threshold at which it becomes less important to get the prediction exactly right For epsilon insensitive any differences between the current prediction and the correct label are ignored if they are less than this threshold

njobs int or None optional defaultNone The number of CPUs to use to do the OVS A One Versus All for multiclass problems computation None means 1 unless in a joblib parallel backend context 1 means using all processors See Glossary for more details

randomstate int RandomState instance or None optional defaultNone The seed of the pseudo random number generator to use when shuffling the data If int randomstate is the seed used by the random number generator If RandomState instance randomstate is the random number generator If None the random number generator is the RandomState instance used by np.random

learningrate string optional The learning rate schedule

'constant' eta eta0

'optimal' default eta = 10 * alpha * t / t0 where t0 is chosen by a heuristic proposed by Leon Bottou

'invscaling' eta eta0 * pow(t, -power)

'adaptive' eta eta0 as long as the training keeps decreasing Each time

niter no change consecutive epochs fail to decrease the training loss by tol or fail to

1940 Chapter 6 API (Application Programming Interface) Reference

scikitlearn user guide Release 0.21.3

increase validation score by tol if earlystopping is True the current learning rate is divided by 5

eta0 double The initial learning rate for the ‘constant’ ‘invscaling’ or ‘adaptive’ schedules The default value is 0.0 as eta0 is not used by the default schedule ‘optimal’

power_t double The exponent for inverse scaling learning rate default 0.5

earlystopping bool default False Whether to use early stopping to terminate training when validation score is not improving If set to True it will automatically set aside a stratified fraction of training data as validation and terminate training when validation score is not improving by at least tol for niter_nocchange consecutive epochs

New in version 0.20

validationfraction float default 0.1 The proportion of training data to set aside as validation set for early stopping Must be between 0 and 1 Only used if earlystopping is True

New in version 0.20

niter_nocchange int default 5 Number of iterations with no improvement to wait before early stopping

New in version 0.20

class_weight dict class_label weight or “balanced” or None optional Preset for the class_weight fit parameter

Weights associated with classes If not given all classes are supposed to have weight one The “balanced” mode uses the values of y to automatically adjust weights inversely proportional to class frequencies in the input data as n_samples / n_classes np

bincount_y warmstart bool optional When set to True reuse the solution of the previous call to fit as initialization otherwise just erase the previous solution See the Glossary Repeatedly calling fit or partial_fit when warmstart is True can result in a different solution than when calling fit a single time because of the way the data is shuffled If a dynamic learning rate is used the learning rate is adapted depending on the number of samples already seen Calling fit resets this counter while partial_fit will result in increasing the existing counter

average bool or int optional When set to True computes the averaged SGD weights and stores the result in the coef attribute If set to an int greater than 1 averaging will begin once the total number of samples seen reaches average So average=10 will begin averaging after seeing 10 samples

Attributes

coef array shape (1, n_features) if n_classes == 2 else (n_classes, n_features) Weights assigned to the features

intercept array shape (1,) if n_classes == 2 else (n_classes,) Constants in decision function

n_iter int The actual number of iterations to reach the stopping criterion For multiclass fits it is the maximum over every binary fit

loss_function concrete LossFunction

decision_function(self, X) Predict confidence scores for samples

The confidence score for a sample is the signed distance of that sample to the hyperplane

Parameters

X: array-like or sparse matrix shape (n_samples, n_features) Samples

Returns

array shape (n_samples, n_classes) if n_classes > 2 else (n_samples, n_classes) Confidence scores per sample class combination In the binary case confidence score for self.classes_[1] where 0 means this class would be predicted

1942 Chapter 6 API (Application Programming Interface) Reference

scikitlearn user guide Release 0213

densifyself

Convert coefficient matrix to dense array format

Converts the coef member back to a numpyndarray This is the default format of coef and is required for fitting so calling this method is only required on models that have previously been sparsified otherwise it is a noop

Returns

self estimator

fitselfXycoefinitNone interceptinitNone sampleweightNone

Fit linear model with Stochastic Gradient Descent

Parameters

Xarraylike sparse matrix shape nsamples nfeatures Training data

ynumpy array shape nsamples Target values

coefinit array shape nclasses nfeatures The initial coefficients to warmstart the optimization

interceptinit array shape nclasses The initial intercept to warmstart the optimization

sampleweight arraylike shape nsamples optional Weights applied to individual samples If not provided uniform weights are assumed These weights will be multiplied with classweight passed through the constructor if classweight is specified

Returns

self returns an instance of self

getparams selfdeepTrue

Get parameters for this estimator

Parameters

deep boolean optional If True will return the parameters for this estimator and contained subobjects that are estimators

Returns

params mapping of string to any Parameter names mapped to their values

partialfit selfXyclassesNone sampleweightNone

Perform one epoch of stochastic gradient descent on given samples

Internally this method uses maxiter 1 Therefore it is not guaranteed that a minimum of the cost function is reached after calling it once Matters such as objective convergence and early stopping should be handled by the user

Parameters

Xarraylike sparse matrix shape nsamples nfeatures Subset of the training data

ynumpy array shape nsamples Subset of the target values

classes array shape nclasses Classes across all calls to partialfit Can be obtained by vianpuniqueyall where yall is the target vector of the entire dataset This

argument is required for the first call to partialfit and can be omitted in the subsequent calls Note that y doesn't need to contain all labels in classes

sampleweight arraylike shape nsamples optional Weights applied to individual samples If not provided uniform weights are assumed

622sklearnlinearmodel Generalized Linear Models 1943

scikitlearn user guide Release 0213

Returns

self returns an instance of self

predictselfX

Predict class labels for samples in X

Parameters

Xarraylike or sparse matrix shape nsamples nfeatures Samples

Returns

Carray shape nsamples Predicted class label per sample

predictlogproba

Log of probability estimates

This method is only available for log loss and modified Huber loss

When loss"modifiedhuber" probability estimates may be hard zeros and ones so taking the logarithm is not possible

Seepredictproba for details

Parameters

Xarraylike shape nsamples nfeatures

Returns

Tarraylike shape nsamples nclasses Returns the logprobability of the sample for each class in the model where classes are ordered as they are in selfclasses

predictproba

Probability estimates

This method is only available for log loss and modified Huber loss

Multiclass probability estimates are derived from binary onevsrest estimates by simple normalization as recommended by Zadrozny and Elkan

Binary probability estimates for loss"modifiedhuber" are given by clipdecisionfunctionX 1 1

1 2 For other loss functions it is necessary to perform proper probability calibration by wrapping the classifier with sklearnCalibrationCalibratedClassifierCV instead

Parameters

Xarraylike sparse matrix shape nsamples nfeatures

Returns

array shape nsamples nclasses Returns the probability of the sample for each class in the model where classes are ordered as they are in selfclasses

References

Zadrozny and Elkan "Transforming classifier scores into multiclass probability estimates" SIGKDD'02 <http://www.research.ibm.com/people/zadrozny/kdd2002/Transfpdf>

The justification for the formula in the loss"modifiedhuber" case is in the appendix B in <http://jmlr.csail.mit.edu/papers/volume2/zhang02c/zhang02c.pdf>

1944 Chapter 6 API (Application Programming Interface) Reference

scikitlearn user guide Release 0213

scoreselfXysampleweightNone

Returns the mean accuracy on the given test data and labels

In multilabel classification this is the subset accuracy which is a harsh metric since you require for each sample that each label set be correctly predicted

Parameters

Xarraylike shape nsamples nfeatures Test samples

yarraylike shape nsamples or nsamples noutputs True labels for X

sampleweight arraylike shape nsamples optional Sample weights

Returns

score float Mean accuracy of selfpredictX wrt y

sparsify self

Convert coefficient matrix to sparse format

Converts the coef member to a scipysparse matrix which for L1regularized models can be much more memory and storageefficient than the usual numpyndarray representation

Theintercept member is not converted

Returns

self estimator

Notes

For nonsparse models ie when there are not many zeros in coef this may actually increase memory usage so use this method with care A rule of thumb is that the number of zero elements which can be computed with coef_0sum must be more than 50 for this to provide significant benefits

After calling this method further fitting with the partialfit method if any will not work until you call

densify

Examples using sklearnlinearmodelSGDClassifier

- Model Complexity Influence
 - Outofcore classification of text documents
 - Pipelining chaining a PCA (Principal Component Analysis) and a logistic regression
 - SGD Maximum margin separating hyperplane
 - SGD Weighted samples
 - Comparing various online solvers
 - Plot multiclass SGD on the iris dataset
 - Early stopping of Stochastic Gradient Descent

Linear model fitted by minimizing a regularized empirical loss with SGD

SGD stands for Stochastic Gradient Descent the gradient of the loss is estimated each sample at a time and the model is updated along the way with a decreasing strength schedule aka learning rate

The regularizer is a penalty added to the loss function that shrinks model parameters towards the zero vector

using either the squared euclidean norm L2 or the absolute norm L1 or a combination of both Elastic Net If

the parameter update crosses the 00 value because of the regularizer the update is truncated to 00 to allow for learning sparse models and achieve online feature selection

This implementation works with data represented as dense numpy arrays of floating point values for the features

Read more in the User Guide

Parameters

loss str default 'squaredloss' The loss function to be used The possible values are

'squaredloss' 'huber' 'epsiloninsensitive' or 'squaredepsiloninsensitive'

The 'squaredloss' refers to the ordinary least squares fit 'huber' modifies 'squaredloss' to

focus less on getting outliers correct by switching from squared to linear loss past a distance

of epsilon 'epsiloninsensitive' ignores errors less than epsilon and is linear past that this

is the loss function used in SVR (Support Vector Regression) 'squaredepsiloninsensitive' is the same but becomes squared loss past a tolerance of epsilon

penalty str 'none' 'l2' 'l1' or 'elasticnet' The penalty aka regularization term to be used

Defaults to 'l2' which is the standard regularizer for linear SVM (Support Vector Machine) models 'l1' and 'elasticnet'

might bring sparsity to the model feature selection not achievable with 'l2'

alpha float Constant that multiplies the regularization term Defaults to 00001 Also used to

compute learningrate when set to 'optimal'

l1ratio float The Elastic Net mixing parameter with 0 l1ratio 1 l1ratio0 corre

sponds to L2 penalty l1ratio1 to L1 Defaults to 015

fitintercept bool Whether the intercept should be estimated or not If False the data is

assumed to be already centered Defaults to True

maxiter int optional default1000 The maximum number of passes over the training data

aka epochs It only impacts the behavior in the fit method and not the partialfit

New in version 019

tolfloat or None optional default1e3 The stopping criterion If it is not None the itera

tions will stop when loss bestloss tol for niternochange consecutive epochs

New in version 019

shuffle bool optional Whether or not the training data should be shuffled after each epoch

Defaults to True

verbose integer optional The verbosity level

1946 Chapter 6 API (Application Programming Interface) Reference

scikitlearn user guide Release 0213

epsilon float Epsilon in the epsiloninsensitive loss functions only if loss is 'huber' 'epsiloninsensitive' or 'squaredepsiloninsensitive' For 'huber' determines the threshold at which it becomes less important to get the prediction exactly right For epsiloninsensitive any differences between the current prediction and the correct label are ignored if they are less than this threshold

randomstate int RandomState instance or None optional defaultNone The seed of the pseudo random number generator to use when shuffling the data If int randomstate is the seed used by the random number generator If RandomState instance randomstate is the random number generator If None the random number generator is the RandomState instance used by nprandom

learningrate string optional The learning rate schedule

'constant' eta eta0

'optimal' eta 10 alpha t t0 where t0 is chosen by a heuristic proposed by Leon

Bottou

'invscaling' default eta eta0 powt powert

'adaptive' eta eta0 as long as the training keeps decreasing Each time

niternochange consecutive epochs fail to decrease the training loss by tol or fail to increase validation score by tol if earlystopping is True the current learning rate is divided by 5

eta0 double The initial learning rate for the 'constant' 'invscaling' or 'adaptive' schedules The default value is 001

powert double The exponent for inverse scaling learning rate default 05

earlystopping bool defaultFalse Whether to use early stopping to terminate training when validation score is not improving If set to True it will automatically set aside a fraction of training data as validation and terminate training when validation score is not improving by at least tol for niternochange consecutive epochs

New in version 020

validationfraction float default01 The proportion of training data to set aside as validation set for early stopping Must be between 0 and 1 Only used if earlystopping is True

New in version 020

niternochange int default5 Number of iterations with no improvement to wait before early stopping

New in version 020

warmstart bool optional When set to True reuse the solution of the previous call to fit as initialization otherwise just erase the previous solution See the Glossary Repeatedly calling fit or partialfit when warmstart is True can result in a different solution than when calling fit a single time because of the way the data is shuffled If a dynamic learning rate is used the learning rate is adapted depending on the number of samples already seen Calling fit resets this counter while partialfit will result in increasing the existing counter

average bool or int optional When set to True computes the averaged SGD weights and stores the result in the coef attribute If set to an int greater than 1 averaging will begin once the total number of samples seen reaches average So average10 will begin averaging after seeing 10 samples

Attributes

scikitlearn user guide Release 0213

otherwise it is a noop

Returns

self estimator

fitselfXycoefinitNone interceptinitNone sampleweightNone

Fit linear model with Stochastic Gradient Descent

Parameters

Xarraylike sparse matrix shape nsamples nfeatures Training data

ynumpy array shape nsamples Target values

coefinit array shape nfeatures The initial coefficients to warmstart the optimization

interceptinit array shape 1 The initial intercept to warmstart the optimization

sampleweight arraylike shape nsamples optional Weights applied to individual

samples 1 for unweighted

Returns

self returns an instance of self

getparams selfdeepTrue

Get parameters for this estimator

Parameters

deep boolean optional If True will return the parameters for this estimator and contained

subobjects that are estimators

Returns

params mapping of string to any Parameter names mapped to their values

partialfit selfXysampleweightNone

Perform one epoch of stochastic gradient descent on given samples

Internally this method uses maxiter 1 Therefore it is not guaranteed that a minimum of the cost

function is reached after calling it once Matters such as objective convergence and early stopping should

be handled by the user

Parameters

Xarraylike sparse matrix shape nsamples nfeatures Subset of training data

ynumpy array of shape nsamples Subset of target values

sampleweight arraylike shape nsamples optional Weights applied to individual

samples If not provided uniform weights are assumed

Returns

self returns an instance of self

predictselfX

Predict using the linear model

Parameters

Xarraylike sparse matrix shape nsamples nfeatures

Returns

array shape nsamples Predicted target values per element in X

622sklearnlinearmodel Generalized Linear Models 1949

scikitlearn user guide Release 0213

scoreselfXysampleweightNone

Returns the coefficient of determination R2 of the prediction

The coefficient R2 is defined as $1 - \frac{u}{v}$ where u is the residual sum of squares $y_{true} - y_{pred}$

2sum and v is the total sum of squares $y_{true} - y_{truemean}$ 2sum The best possible score

is 10 and it can be negative because the model can be arbitrarily worse A constant model that always

predicts the expected value of y disregarding the input features would get a R2 score of 00

Parameters

Xarraylike shape nsamples nfeatures Test samples For some estimators this may

be a precomputed kernel matrix instead shape nsamples nsamplesfitted where

nsamplesfitted is the number of samples used in the fitting for the estimator

yarraylike shape nsamples or nsamples noutputs True values for X

sampleweight arraylike shape nsamples optional Sample weights

Returns

score float R2 of selfpredictX wrt y

Notes

The R2 score used when calling score on a regressor will use multioutputuniformaverage

from version 023 to keep consistent with metricsr2score This will influence the score

method of all the multioutput regressors except for multioutputMultiOutputRegressor

To specify the default value manually and avoid the warning please either call metricsr2score

directly or make a custom scorer with metricsmakescorer the builtin scorer r2 uses

multioutputuniformaverage

sparsify self

Convert coefficient matrix to sparse format

Converts the coef member to a scipysparse matrix which for L1regularized models can be much more

memory and storageefficient than the usual numpyndarray representation

Theintercept member is not converted

Returns

self estimator

Notes

For nonsparse models ie when there are not many zeros in coef this may actually increase memory

usage so use this method with care A rule of thumb is that the number of zero elements which can be

computed with coef 0sum must be more than 50 for this to provide significant benefits

After calling this method further fitting with the partialfit method if any will not work until you call

densify

classsklearnlinearmodel TheilSenRegressor fitinterceptTrue copyXTrue

maxsubpopulation100000

nsubsamplesNone maxiter300

tol0001 randomstateNone

njobsNone verboseFalse

TheilSen Estimator robust multivariate regression model

The algorithm calculates least square solutions on subsets with size nsubsamples of the samples in X Any value of nsubsamples between the number of features and samples leads to an estimator with a compromise between robustness and efficiency Since the number of least square solutions is “nsamples choose nsubsamples” it can be extremely large and can therefore be limited with maxsubpopulation If this limit is reached the subsets are chosen randomly In a final step the spatial median or L1 median is calculated of all least square solutions
Read more in the User Guide

Parameters

fitintercept boolean optional default True Whether to calculate the intercept for this model
If set to false no intercept will be used in calculations

copyX boolean optional default True If True X will be copied else it may be overwritten
maxsubpopulation int optional default 1e4 Instead of computing with a set of cardinality ‘n choose k’ where n is the number of samples and k is the number of subsamples at least number of features consider only a stochastic subpopulation of a given maximal size if ‘n choose k’ is larger than maxsubpopulation For other than small problem sizes this parameter will determine memory usage and runtime if nsubsamples is not changed
nsubsamples int optional default None Number of samples to calculate the parameters
This is at least the number of features plus 1 if fitinterceptTrue and the number of samples as a maximum A lower number leads to a higher breakdown point and a low efficiency while a high number leads to a low breakdown point and a high efficiency If None take the minimum number of subsamples leading to maximal robustness If nsubsamples is set to nsamples TheilSen is identical to least squares

maxiter int optional default 300 Maximum number of iterations for the calculation of spatial median

tolfloat optional default 1e3 Tolerance when calculating spatial median

randomstate int RandomState instance or None optional default None A random number generator instance to define the state of the random permutations generator If int randomstate is the seed used by the random number generator If RandomState instance randomstate is the random number generator If None the random number generator is the RandomState instance used by nprandom

njobs int or None optional defaultNone Number of CPUs to use during the cross validationNone means 1 unless in a joblibparallelbackend context1means using all processors See Glossary for more details

verbose boolean optional default False Verbose mode when fitting the model

Attributes

coef array shape nfeatures Coefficients of the regression model median of distribution

intercept float Estimated intercept of regression model

breakdown float Approximated breakdown point

niter int Number of iterations needed for the spatial median

622sklearnlinearmodel Generalized Linear Models 1951

scikitlearn user guide Release 0213

nsubpopulation int Number of combinations taken into account from ‘n choose k’ where
n is the number of samples and k is the number of subsamples

LassoLars

LassoCV

LassoLarsCV

sklearn.decomposition.sparse_encode

Notes

For an example see `examples/linear_model/plot_lasso_coordinate_descent_path.py`

To avoid unnecessary memory duplication the `X` argument of the fit method should be directly passed as a

Fortran contiguous numpy array

Note that in certain cases the Lars solver may be significantly faster to implement this functionality In particu

lar linear interpolation can be used to retrieve model coefficients between the values output by `larspath`

Examples

Comparing `lassopath` and `larspath` with interpolation

```
X = np.array([1, 2, 3, 1, 2, 3, 5, 4, 4, 3])
```

```
y = np.array([1, 2, 3, 1, 2, 3, 1, 2, 3, 1])
```

Use `lassopath` to compute a coefficient path

```
coef_path = lassopath(X, y, alphas=[5, 1, 5])
```

```
print(coef_path
```

```

Parameters

Xarraylike sparse matrix LinearOperator shape nsamples nfeatures Training data

yarraylike shape nsamples or nsamples ntargets Target values

alpha float arraylike shape ntargets if arraylike Regularization strength must be

a positive float Regularization improves the conditioning of the problem and reduces the

variance of the estimates Larger values specify stronger regularization Alpha corresponds

to C1 in other linear models such as LogisticRegression or LinearSVC If an array is

passed penalties are assumed to be specific to the targets Hence they must correspond in

number

sampleweight float or numpy array of shape nsamples Individual weights for each sam

ple If sampleweight is not None and solver='auto' the solver will be set to 'cholesky'

New in version 0.17

solver 'auto' 'svd' 'cholesky' 'lsqr' 'sparsecg' 'sag' 'saga' Solver to use in the com

putational routines

- 'auto' chooses the solver automatically based on the type of data

- 'svd' uses a Singular Value Decomposition of X to compute the Ridge coefficients More

stable for singular matrices than 'cholesky'

622sklearnlinearmodel.Generalized Linear Models 1963

scikitlearn user guide Release 0213

- ‘cholesky’ uses the standard `scipy.linalg.solve` function to obtain a closedform solution via a Cholesky decomposition of `dot(XT, X)`
 - ‘sparsecg’ uses the conjugate gradient solver as found in `scipysparselinalg.cg`. As an iterative algorithm this solver is more appropriate than ‘cholesky’ for largescale data possibility to set `tol` and `maxiter`
 - ‘lsqr’ uses the dedicated regularized leastsquares routine `scipysparselinalg.lsqr`. It is the fastest and uses an iterative procedure
 - ‘sag’ uses a Stochastic Average Gradient descent and ‘saga’ uses its improved unbiased version named SAGA. Both methods also use an iterative procedure and are often faster than other solvers when both `nsamples` and `nfeatures` are large. Note that ‘sag’ and ‘saga’ fast convergence is only guaranteed on features with approximately the same scale. You can preprocess the data with a scaler from `sklearn.preprocessing`.
- All last five solvers support both dense and sparse data. However only ‘sag’ and ‘sparsecg’ supports sparse input when `fit_intercept` is `True`.

New in version 0.17: Stochastic Average Gradient descent solver

New in version 0.19: SAGA solver

`max_iter` int optional Maximum number of iterations for conjugate gradient solver. For the ‘sparsecg’ and ‘lsqr’ solvers the default value is determined by `scipysparselinalg`. For ‘sag’ and saga solver the default value is 1000.
`tol` float Precision of the solution

`verbose` int Verbosity level. Setting `verbose = 0` will display additional information depending on the solver used.

`random_state` int RandomState instance or None optional default None The seed of the pseudo random number generator to use when shuffling the data. If int `random_state` is the seed used by the random number generator. If RandomState instance `random_state` is the random number generator. If None the random number generator is the RandomState instance used by `nprandom`. Used when solver ‘sag’.

`return_niter` boolean default False If True the method also returns `niter` the actual number of iteration performed by the solver.

New in version 0.17

`return_intercept` boolean default False If True and if `X` is sparse the method also returns the intercept and the solver is automatically changed to ‘sag’. This is only a temporary fix for fitting the intercept with sparse data. For dense data use `sklearn.linear_model.preprocess_data` before your regression.

New in version 0.17

`check_input` boolean default True If False the input arrays `X` and `y` will not be checked.

New in version 0.21

Returns
`coef` array shape `nfeatures` or `ntargets` `nfeatures` Weight vectors
`niter` int optional The actual number of iteration performed by the solver. Only returned if `return_niter` is True

`intercept` float or array shape `ntargets` The intercept of the model. Only returned if `return_intercept` is True and if `X` is a scipy sparse array

1964 Chapter 6: API (Application Programming Interface) Reference

scikitlearn user guide Release 0213

Notes

This function won't compute the intercept

subobjects that are estimators

Returns

params mapping of string to any Parameter names mapped to their values

reconstructionerror self

Compute the reconstruction error for the embedding

Returns

reconstructionerror float

Notes

The cost function of an isomap embedding is

$E = \text{frobeniusnorm}(KD - KD_{\text{fit}})$ / nsamples

Where D is the matrix of distances for the input data X Dfit is the matrix of distances for the output

embedding Xfit and K is the isomap kernel

$KD = \frac{1}{n_1 n_2} \sum_{i=1}^{n_1} \sum_{j=1}^{n_2} D_{ij}^2$ / nsamples

setparams selfparams

Set the parameters of this estimator

The method works on simple estimators as well as on nested objects such as pipelines The latter have parameters of the form componentparameter so that it's possible to update each component

of a nested object

Returns

self

transform selfX

Transform X

623sklearnmanifold Manifold Learning 1967

scikitlearn user guide Release 0213

This is implemented by linking the points X into the graph of geodesic distances of the training data. First then nearest neighbors of X are found in the training data and from these the shortest geodesic distances from each point in X to each point in the training data are computed in order to construct the kernel. The embedding of X is the projection of this kernel onto the embedding vectors of the training set.

Parameters

X arraylike shape nsamples nfeatures

Returns

Xnew arraylike shape nsamples ncomponents

6234sklearnmanifold SpectralEmbedding

classsklearnmanifold SpectralEmbedding ncomponents2 affinity'nearestneighbors'

gammaNone randomstateNone

eigensolverNone nneighborsNone

njobsNone

Spectral embedding for nonlinear dimensionality reduction

Forms an affinity matrix given by the specified function and applies spectral decomposition to the corresponding

graph laplacian The resulting transformation is given by the value of the eigenvectors for each data point

Note Laplacian Eigenmaps is the actual algorithm implemented here

Read more in the User Guide

Parameters

ncomponents integer default 2 The dimension of the projected subspace

affinity string or callable default

How to construct the affinity matrix

- 'nearestneighbors' construct affinity matrix by knn graph
- 'rbf' construct affinity matrix by rbf kernel
- 'precomputed' interpret X as precomputed affinity matrix
- callable use passed in function as affinity the function takes in data matrix nsamples

nfeatures and return affinity matrix nsamples nsamples

gamma float optional default Kernel coefficient for rbf kernel

randomstate int RandomState instance or None optional default None A pseudo random

number generator used for the initialization of the lobpcg eigenvectors If int randomstate is

the seed used by the random number generator If RandomState instance randomstate is

the random number generator If None the random number generator is the RandomState

instance used by nprandom Used when solver 'amg'

eigensolver None 'arpack' 'lobpcg' or 'amg' The eigenvalue decomposition strategy to

use AMG requires pyamg to be installed It can be faster on very large sparse problems

but may also lead to instabilities

nneighbors int default Number of nearest neighbors for nearestneighbors graph building

njobs int or None optional defaultNone The number of parallel jobs to run None means

1 unless in a joblibparallelbackend context1means using all processors See

tdistributed Stochastic Neighbor Embedding

tSNE 1 is a tool to visualize highdimensional data It converts similarities between data points to joint

probabilities and tries to minimize the KullbackLeibler divergence between the joint probabilities of the low

dimensional embedding and the highdimensional data tSNE has a cost function that is not convex ie with

different initializations we can get different results

It is highly recommended to use another dimensionality reduction method eg PCA (Principal Component Analysis) for dense data or Truncat

edSVD for sparse data to reduce the number of dimensions to a reasonable amount eg 50 if the number of

features is very high This will suppress some noise and speed up the computation of pairwise distances between

samples For more tips see Laurens van der Maaten's FAQ 2

Read more in the User Guide

Parameters

ncomponents int optional default 2 Dimension of the embedded space

perplexity float optional default 30 The perplexity is related to the number of nearest

neighbors that is used in other manifold learning algorithms Larger datasets usually require

a larger perplexity Consider selecting a value between 5 and 50 Different values can result

in significantly different results

1976 Chapter 6 API (Application Programming Interface) Reference

scikitlearn user guide Release 0213

earlyexaggeration float optional default 120 Controls how tight natural clusters in the original space are in the embedded space and how much space will be between them For larger values the space between natural clusters will be larger in the embedded space Again the choice of this parameter is not very critical If the cost function increases during initial optimization the early exaggeration factor or the learning rate might be too high learningrate float optional default 2000 The learning rate for tSNE is usually in the range 100 10000 If the learning rate is too high the data may look like a 'ball' with any point approximately equidistant from its nearest neighbours If the learning rate is too low most points may look compressed in a dense cloud with few outliers If the cost function gets stuck in a bad local minimum increasing the learning rate may help niter int optional default 1000 Maximum number of iterations for the optimization Should be at least 250

niterwithoutprogress int optional default 300 Maximum number of iterations without progress before we abort the optimization used after 250 initial iterations with early exaggeration Note that progress is only checked every 50 iterations so this value is rounded to the next multiple of 50

New in version 017 parameter niterwithoutprogress to control stopping criteria mingradnorm float optional default 1e7 If the gradient norm is below this threshold the optimization will be stopped

metric string or callable optional The metric to use when calculating distance between instances in a feature array If metric is a string it must be one of the options allowed by scipyspatialdistancepdist for its metric parameter or a metric listed in pairwisePAIRWISEDISTANCEFUNCTIONS If metric is "precomputed" X is assumed to be a distance matrix Alternatively if metric is a callable function it is called on each pair of instances rows and the resulting value recorded The callable should take two arrays from X as input and return a value indicating the distance between them The default is "euclidean" which is interpreted as squared euclidean distance

init string or numpy array optional default "random" Initialization of embedding Possible options are 'random' 'pca' and a numpy array of shape nsamples ncomponents PCA (Principal Component Analysis) initialization cannot be used with precomputed distances and is usually more globally stable than random initialization

verbose int optional default 0 Verbosity level

randomstate int RandomState instance or None optional default None If int randomstate is the seed used by the random number generator If RandomState instance randomstate is the random number generator If None the random number generator is the RandomState instance used by nprandom Note that different initializations might result in different local minima of the cost function

method string default 'barneshut' By default the gradient calculation algorithm uses BarnesHut approximation running in $O(N \log N)$ time method'exact' will run on the slower but exact algorithm in $O(N^2)$ time The exact algorithm should be used when nearestneighbor errors need to be better than 3 However the exact method cannot scale to millions of examples

New in version 017 Approximate optimization method via the BarnesHut

angle float default 05 Only used if method'barneshut' This is the tradeoff between speed and accuracy for BarnesHut TSNE 'angle' is the angular size referred to as theta in 3 of a distant node as measured from a point If this size is below 'angle' then it is used as a summary node of all points contained within it This method is not very sensitive to 623sklearnmanifold Manifold Learning 1977

scikitlearn user guide Release 0213

changes in this parameter in the range of 0.2 - 0.8 Angle less than 0.2 has quickly increasing computation time and angle greater 0.8 has quickly increasing error

Attributes

embedding arraylike shape n_samples n_components Stores the embedding vectors

kldivergence float KullbackLeibler divergence after optimization

niter int Number of iterations run

niter=1000 n_iter_without_progress=300 min_grad_norm=1e-07 metric='euclidean'

init='random' verbose=0 random_state=None method='barnes_hut' angle=0.5

fitself X y None

Fit X into an embedded space

Parameters

X array shape n_samples n_features or n_samples n_samples If the metric is 'precomputed' X must be a square distance matrix Otherwise it contains a sample per row If the method is 'exact' X may be a sparse matrix of type 'csr' 'csc' or 'coo'

ylgnored

fittransform self X y None

Fit X into an embedded space and return that transformed output

1978 Chapter 6 API (Application Programming Interface) Reference

scikitlearn user guide Release 0213

Parameters

Xarray shape nsamples nfeatures or nsamples nsamples If the metric is 'pre computed' X must be a square distance matrix Otherwise it contains a sample per row

ylgnored

Returns

Xnew array shape nsamples ncomponents Embedding of the training data in low dimensional space

getparams selfdeepTrue

Get parameters for this estimator

Parameters

deep boolean optional If True will return the parameters for this estimator and contained subobjects that are estimators

Returns

params mapping of string to any Parameter names mapped to their values

setparams selfparams

Set the parameters of this estimator

The method works on simple estimators as well as on nested objects such as pipelines The latter have parameters of the form componentparameter so that it's possible to update each component of a nested object

Returns

self

Parameters

Xarraylike NearestNeighbors Sample data shape nsamples nfeatures in the form of a numpy array or a NearestNeighbors object

nneighbors integer number of neighbors to consider for each point

ncomponents integer number of coordinates for the manifold

regfloat regularization constant multiplies the trace of the local covariance matrix of the distances

eigensolver string ‘auto’ ‘arpack’ ‘dense’ auto algorithm will attempt to choose the best method for input data

arpack use arnoldi iteration in shiftinvert mode For this method M may be a dense matrix sparse matrix or general linear operator Warning ARPACK can be unstable for some problems It is best to try several random seeds in order to check results

dense use standard dense matrix operations for the eigenvalue decomposition For this method M must be an array or matrix type This method should be avoided for large problems

tolfloat optional Tolerance for ‘arpack’ method Not used if eigensolver ‘dense’

maxiter integer maximum number of iterations for the arpack solver

method ‘standard’ ‘hessian’ ‘modified’ ‘ltsa’

standard use the standard locally linear embedding algorithm see reference 1

hessian use the Hessian eigenmap method This method requires nneighbors

ncomponents 1 ncomponents 1 2 see reference 2

modified use the modified locally linear embedding algorithm see reference 3

ltsa use local tangent space alignment algorithm see reference 4

hessian_tol float optional Tolerance for Hessian eigenmapping method Only used if method ‘hessian’

modified_tol float optional Tolerance for modified LLE method Only used if method ‘modified’

randomstate int RandomState instance or None optional defaultNone If int randomstate is the seed used by the random number generator If RandomState instance randomstate is the random number generator If None the random number generator is the RandomState instance used by np.random Used when solver ‘arpack’

njobs int or None optional defaultNone The number of parallel jobs to run for neighbors searchNone means 1 unless in a joblibparallelbackend context1means using all processors See Glossary for more details

Returns

Yarraylike shape nsamples ncomponents Embedding vectors

squarederror float Reconstruction error for the embedding vectors Equivalent to normY - W Y fro 2 where W are the reconstruction weights

returnniterFalse

Computes multidimensional scaling using the SMACOF algorithm

The SMACOF Scaling by MAjorizing a COmplicated Function algorithm is a multidimensional scaling algo
rithm which minimizes an objective function the stress using a majorization technique Stress majorization
also known as the Guttman Transform guarantees a monotone convergence of stress and is more powerful than
traditional techniques such as gradient descent

The SMACOF algorithm for metric MDS can summarized by the following steps

1 Set an initial start configuration randomly or not

2 Compute the stress

3 Compute the Guttman Transform

4 Iterate 2 and 3 until convergence

The nonmetric algorithm adds a monotonic regression step before computing the stress

Parameters

dissimilarities ndarray shape nsamples nsamples Pairwise dissimilarities between the
points Must be symmetric

metric boolean optional default True Compute metric or nonmetric SMACOF algorithm
ncomponents int optional default 2 Number of dimensions in which to immerse the dis
similarities If an init array is provided this option is overridden and the shape of init
is used to determine the dimensionality of the embedding space

init ndarray shape nsamples ncomponents optional default None Starting configura
tion of the embedding to initialize the algorithm By default the algorithm is initialized
with a randomly chosen array

ninit int optional default 8 Number of times the SMACOF algorithm will be run with
different initializations The final results will be the best output of the runs determined by
the run with the smallest final stress If init is provided this option is overridden and a
single run is performed

njobs int or None optional defaultNone The number of jobs to use for the computation
If multiple initializations are used ninit each run of the algorithm is computed in
parallel

None means 1 unless in a joblibparallelbackend context1means using all
processors See Glossary for more details

623sklearnmanifold Manifold Learning 1981

scikitlearn user guide Release 0213

maxiter int optional default 300 Maximum number of iterations of the SMACOF algorithm for a single run

verbose int optional default 0 Level of verbosity

eps float optional default 1e3 Relative tolerance with respect to stress at which to declare convergence

randomstate int RandomState instance or None optional default None The generator used to initialize the centers If int randomstate is the seed used by the random number generator If RandomState instance randomstate is the random number generator If None the random number generator is the RandomState instance used by np.random

return_niter bool optional default False Whether or not to return the number of iterations

Returns
X ndarray shape (n_samples, n_components) Coordinates of the points in a n_components space
stress float The final value of the stress sum of squared distance of the disparities and the distances for all constrained points
niter int The number of iterations corresponding to the best stress Returned only if return_niter is set to True

6238 sklearn.manifold.SpectralEmbedding
sklearn.manifold.SpectralEmbedding adjacency n_components=8 eigensolver=None random_state=None epsilon=1e-05 norm_laplacian=True drop_first=True

Project the sample on the first eigenvectors of the graph Laplacian
The adjacency matrix is used to compute a normalized graph Laplacian whose spectrum especially the eigen vectors associated to the smallest eigenvalues has an interpretation in terms of minimal number of cuts necessary to split the graph into comparably sized components
This embedding can also ‘work’ even if the adjacency variable is not strictly the adjacency matrix of a graph but more generally an affinity or similarity matrix between samples for instance the heat kernel of a euclidean distance matrix or a kNN matrix
However care must be taken to always make the affinity matrix symmetric so that the eigenvector decomposition works as expected

Note Laplacian Eigenmaps is the actual algorithm implemented here
Read more in the User Guide

Parameters
1982 Chapter 6 API (Application Programming Interface) Reference

scikitlearn user guide Release 0213

adjacency arraylike or sparse matrix shape nsamples nsamples The adjacency matrix of the graph to embed

ncomponents integer optional default 8 The dimension of the projection subspace

eigensolver None ‘arpack’ ‘lobpcg’ or ‘amg’ default None The eigenvalue decomp

sition strategy to use AMG requires pyamg to be installed It can be faster on very large

sparse problems but may also lead to instabilities

randomstate int RandomState instance or None optional default None A pseudo random

number generator used for the initialization of the lobpcg eigenvectors decomposition If int

randomstate is the seed used by the random number generator If RandomState instance

randomstate is the random number generator If None the random number generator is the

RandomState instance used by nprandom Used when solver ‘amg’

eigentol float optional default00 Stopping criterion for eigendecomposition of the Lapla
cian matrix when using arpack eigensolver

normlaplacian bool optional defaultTrue If True then compute normalized Laplacian

dropfirst bool optional defaultTrue Whether to drop the first eigenvector For spectral em

bedding this should be True as the first eigenvector should be constant vector for connected

graph but for spectral clustering this should be kept as False to retain the first eigenvector

Returns

embedding array shapensamples ncomponents The reduced samples

Notes

Spectral Embedding Laplacian Eigenmaps is most useful when the graph has one connected component If

there graph has many components the first few eigenvectors will simply uncover the connected components of
the graph

metricsmakescorer scorefunc Make a scorer from a performance metric or loss function

sklearnmetrics checkscoring

sklearnmetrics checkscoring estimator scoringNone allownoneFalse

Determine scorer from user options

A TypeError will be thrown if the estimator cannot be scored

Parameters

estimator estimator object implementing ‘fit’ The object to use to fit the data

scoring string callable or None optional default None A string see model evaluation doc
umentation or a scorer callable object function with signature scorerestimator

X y

allownone boolean optional default False If no scoring is specified and the estimator has
no score function we can either return None or raise an exception

Returns

scoring callable A scorer callable object function with signature scorerestimator

X y

sklearnmetrics getscorer

sklearnmetrics getscorer scoring

Get a scorer from string

Parameters

scoring str callable scoring method as string If callable it is returned as is

Returns

scorer callable The scorer

sklearnmetrics makescorer

sklearnmetrics makescorer scorefunc greaterisbetterTrue needsprobaFalse

needsthresholdFalse kwargs

Make a scorer from a performance metric or loss function

This factory function wraps scoring functions for use in GridSearchCV and crossvalscore It takes

a score function such as accuracyscore meansquarederror adjustedrandindex or

averageprecision and returns a callable that scores an estimator’s output

Read more in the User Guide

Parameters

scorefunc callable Score function or loss function with signature scorefuncy

ypred kwargs

greaterisbetter boolean defaultTrue Whether scorefunc is a score function default

meaning high is good or a loss function meaning low is good In the latter case the scorer

object will signflip the outcome of the scorefunc

scikitlearn user guide Release 0213

needsproba boolean defaultFalse Whether scorefunc requires predictproba to get probability estimates out of a classifier

If True for binary ytrue the score function is supposed to accept a 1D ypred ie probability of the positive class shape nsamples

needsthreshold boolean defaultFalse Whether scorefunc takes a continuous decision certainty This only works for binary classification using estimators that have either a decisionfunction or predictproba method

If True for binary ytrue the score function is supposed to accept a 1D ypred ie probability of the positive class or the decision function shape nsamples

For example averageprecision or the area under the roc curve can not be computed using discrete predictions alone

kwargs additional arguments Additional parameters to be passed to scorefunc

Returns

scorer callable Callable object that returns a scalar score greater is better

Examples

```
from sklearn.metrics import fbeta_score, make_scorer
ftwo_scorer = make_scorer(fbeta_score, beta=2)
ftwo_scorer
make_scorer(fbeta_score, beta=2)
from sklearn.model_selection import GridSearchCV
from sklearn.svm import LinearSVC
grid = GridSearchCV(LinearSVC(), param_grid={'C': 1, 'gamma': 10},
                    scoring=ftwo_scorer)
```

`sklearnmetrics accuracyscore`

`sklearnmetrics accuracyscore ytrue ypred normalizeTrue sampleweightNone`

 Accuracy classification score

In multilabel classification this function computes subset accuracy the set of labels predicted for a sample must exactly match the corresponding set of labels in ytrue

Read more in the User Guide

Parameters

`ytrue` 1d arraylike or label indicator array sparse matrix Ground truth correct labels

`ytrue` 1d arraylike or label indicator array sparse matrix Predicted labels as returned by a classifier

`normalize` bool optional defaultTrue If False return the number of correctly classified

`samples` Otherwise return the fraction of correctly classified samples

`sampleweight` arraylike of shape nsamples optional Sample weights

Returns

`score` float If`normalize` True return the fraction of correctly classified samples

float else returns the number of correctly classified samples int

The best performance is 1 with `normalize` True and the number of samples with

`normalize` False

See also

`jaccardscore` `hammingloss` `zerooneloss`

scikitlearn user guide Release 0213

Notes

In binary and multiclass classification this function is equal to the jaccardscore function

Examples

```
from sklearn.metrics import accuracyscore
ypred 0 2 1 3
ytrue 0 1 2 3
accuracyscoreytrue ypred
05
accuracyscoreytrue ypred normalize False
2
```

- Multiclass AdaBoosted Decision Trees
- Probabilistic predictions with Gaussian process classification GPC
- Demonstration of multimetric evaluation on crossvalscore and GridSearchCV
- Importance of Feature Scaling
- Classification of text documents using sparse features

```
sklearn.metrics auc
sklearn.metrics aucxyreorder'deprecated'
```

Compute Area Under the Curve AUC using the trapezoidal rule

This is a general function given points on a curve For computing the area under the ROC curve see rocaucscore For an alternative way to summarize a precisionrecall curve see averageprecisionscore

Parameters

xarray shape n x coordinates These must be either monotonic increasing or monotonic decreasing
yarray shape n y coordinates
reorder boolean optional default'deprecated' Whether to sort x before computing If False assume that x must be either monotonic increasing or monotonic decreasing If True y is used to break ties when sorting x Make sure that y has a monotonic relation to x when setting reorder to True

Deprecated since version 020 Parameter reorder has been deprecated in version 020 and will be removed in 022 It's introduced for rocaucscore not for general use and is 624sklearn.metrics Metrics 1987

scikitlearn user guide Release 0213

no longer used there What’s more the result from auc will be significantly influenced if x is sorted unexpectedly due to slight floating point error See issue 9786 Future and default behavior is equivalent to reorderFalse

Returns

auc float

See also

rocaucscore Compute the area under the ROC curve

averageprecisionscore Compute average precision from prediction scores

precisionrecallcurve Compute precisionrecall pairs for different probability thresholds

Examples

```
import numpy as np
from sklearn import metrics
y nparray1 1 2 2
pred nparray01 04 035 08
fpr tpr thresholds metricsroccurve pred poslabel2
metricsaucfpr tpr
075
```

Examples using sklearnmetricsauc

- Species distribution modeling
- Receiver Operating Characteristic ROC with cross validation
- Receiver Operating Characteristic ROC

sklearnmetrics averageprecisionscore

sklearnmetrics averageprecisionscore ytrue yscore average’macro’ poslabel1

sampleweightNone

Compute average precision AP from prediction scores

AP summarizes a precisionrecall curve as the weighted mean of precisions achieved at each threshold with the increase in recall from the previous threshold used as the weight

APΣ

precisionrecall−1

where precisionandrecallare the precision and recall at the nth threshold 1 This implementation is not interpolated and is different from computing the area under the precisionrecall curve with the trapezoidal rule which uses linear interpolation and can be too optimistic

Note this implementation is restricted to the binary classification task or multilabel classification task

Read more in the User Guide

Parameters

ytrue array shape nsamples or nsamples nclasses True binary labels or binary label indicators

1988 Chapter 6 API (Application Programming Interface) Reference

scikitlearn user guide Release 0213

yscore array shape nsamples or nsamples nclasses Target scores can either be probability estimates of the positive class confidence values or nonthresholded measure of decisions as returned by “decisionfunction” on some classifiers
average string None ‘micro’ ‘macro’ default ‘samples’ ‘weighted’ If None the scores for each class are returned Otherwise this determines the type of averaging performed on the data

micro Calculate metrics globally by considering each element of the label indicator matrix as a label

macro Calculate metrics for each label and find their unweighted mean This does not take label imbalance into account

weighted Calculate metrics for each label and find their average weighted by support the number of true instances for each label

samples Calculate metrics for each instance and find their average

Will be ignored when ytrue is binary

poslabel int or str default1 The label of the positive class Only applied to binary

ytrue For multilabelindicator ytrue poslabel is fixed to 1

sampleweight arraylike of shape nsamples optional Sample weights

Returns

averageprecision float

See also

rocaucscore Compute the area under the ROC curve

precisionrecallcurve Compute precisionrecall pairs for different probability thresholds

Notes

Changed in version 019 Instead of linearly interpolating between operating points precisions are weighted by the change in recall since the last operating point

sklearnmetrics brierscoreloss

sklearnmetrics brierscoreloss ytrue yprob sampleweightNone poslabelNone

Compute the Brier score The smaller the Brier score the better hence the naming with “loss” Across all items in a set N predictions the Brier score measures the mean squared difference between 1 the predicted probability assigned to the possible outcomes for item i and 2 the actual outcome Therefore the lower the Brier score is for a set of predictions the better the predictions are calibrated Note that the Brier score always takes on a value between zero and one since this is the largest possible difference between a predicted probability which must be between zero and one and the actual outcome which can take on values of only 0 and 1 The Brier loss is composed of refinement loss and calibration loss The Brier score is appropriate for binary and categorical outcomes that can be structured as true or false but is inappropriate for ordinal variables which can take on three or more values this is because the Brier score assumes that all possible outcomes are equivalently “distant” from one another Which label is considered to be the positive label is controlled via the parameter poslabel which defaults to 1 Read more in the User Guide

Parameters

ytrue array shape nsamples True targets

yprob array shape nsamples Probabilities of the positive class

sampleweight arraylike of shape nsamples optional Sample weights

poslabel int or str defaultNone Label of the positive class Defaults to the greater label

unless ytrue is all 0 or all 1 in which case poslabel defaults to 1

Returns

score float Brier score

- Probability calibration of classifiers

sklearnmetrics classificationreport
sklearnmetrics classificationreport ytrue ypred labelsNone targetnamesNone
sampleweightNone digits2 outputdictFalse
Build a text report showing the main classification metrics
Read more in the User Guide

Parameters

ytrue 1d arraylike or label indicator array sparse matrix Ground truth correct target values

ypred 1d arraylike or label indicator array sparse matrix Estimated targets as returned by a classifier

labels array shape nlabels Optional list of label indices to include in the report

targetnames list of strings Optional display names matching the labels same order

sampleweight arraylike of shape nsamples optional Sample weights

digits int Number of digits for formatting output floating point values When outputdict isTrue this will be ignored and the returned values will not be rounded

outputdict bool default False If True return output as dict

Returns

report string dict Text summary of the precision recall F1 score for each class Dictionary returned if outputdict is True Dictionary has the following structure

label 1 precision05
recall10
f1score067
support1
label 2

The reported averages include macro average averaging the unweighted mean per label weighted average averaging the supportweighted mean per label sample average only for multilabel classification and micro average averaging the to tal true positives false negatives and false positives it is only shown for multi label or multiclass with a subset of classes because it is accuracy otherwise See alsofuncprecisionrecallfscoresupport for more details on averages

Note that in binary classification recall of the positive class is also known as “sensitivity” recall of the negative class is “specificity”

sklearn.metrics.cohenkappascore
sklearn.metrics.cohenkappascore y1 y2 labels=None weights=None sample_weight=None
Cohen's kappa a statistic that measures interannotator agreement
624sklearn.metrics Metrics 1993
```

scikitlearn user guide Release 0213

This function computes Cohen’s kappa 1 a score that expresses the level of agreement between two annotators on a classification problem It is defined as

$$\kappa = \frac{p - p_e}{1 - p_e}$$

where p is the empirical probability of agreement on the label assigned to any sample the observed agreement ratio and p_e is the expected agreement when both annotators assign labels randomly p_e is estimated using a perannotator empirical prior over the class labels 2

Read more in the User Guide

Parameters

y1array shape nsamples Labels assigned by the first annotator
y2array shape nsamples Labels assigned by the second annotator The kappa statistic is symmetric so swapping y1andy2doesn’t change the value
labels array shape nclasses optional List of labels to index the matrix This may be used to select a subset of labels If None all labels that appear at least once in y1ory2are used
weights str optional List of weighting type to calculate the score None means no weighted “linear” means linear weighted “quadratic” means quadratic weighted
sampleweight arraylike of shape nsamples optional Sample weights

Returns

kappa float The kappa statistic which is a number between -1 and 1 The maximum value means complete agreement zero or lower means chance agreement

sklearnmetrics confusionmatrix

sklearnmetrics confusionmatrix ytrue ypred labelsNone sampleweightNone

Compute confusion matrix to evaluate the accuracy of a classification

By definition a confusion matrix C is such that C_{ij} is equal to the number of observations known to be in group j but predicted to be in group i

Thus in binary classification the count of true negatives is C_{00} false negatives is C_{10} true positives is C_{11} and false positives is C_{01}

Read more in the User Guide

Parameters

ytrue array shape nsamples Ground truth correct target values
ypred array shape nsamples Estimated targets as returned by a classifier
labels array shape nclasses optional List of labels to index the matrix This may be used to reorder or select a subset of labels If none is given those that appear at least once in ytrue orypred are used in sorted order
sampleweight arraylike of shape nsamples optional Sample weights

Returns

```
sklearnmetrics f1score
sklearnmetrics f1score ytrue ypred labelsNone poslabel1 average'binary' sam
pleweightNone
```

Compute the F1 score also known as balanced Fscore or Fmeasure

The F1 score can be interpreted as a weighted average of the precision and recall where an F1 score reaches its best value at 1 and worst score at 0 The relative contribution of precision and recall to the F1 score are equal

The formula for the F1 score is

$$F1 = \frac{2 \times \text{precision} \times \text{recall}}{\text{precision} + \text{recall}}$$

scikitlearn user guide Release 0213

In the multiclass and multilabel case this is the average of the F1 score of each class with weighting depending on the average parameter

Read more in the User Guide

Parameters

ytrue 1d arraylike or label indicator array sparse matrix Ground truth correct target values

ypred 1d arraylike or label indicator array sparse matrix Estimated targets as returned by a classifier

labels list optional The set of labels to include when average binary and their order if average is None Labels present in the data can be excluded for example to calculate a multiclass average ignoring a majority negative class while labels not present in the data will result in 0 components in a macro average For multilabel targets labels are column indices By default all labels in ytrue and ypred are used in sorted order Changed in version 0.17 parameter labels improved for multiclass problem poslabel str or int 1 by default The class to report if average binary and the data is binary If the data are multiclass or multilabel this will be ignored setting labels_poslabel and average binary will report scores for that label only

average string None 'binary' default 'micro' 'macro' 'samples' 'weighted' This parameter is required for multiclassmultilabel targets If None the scores for each class are returned Otherwise this determines the type of averaging performed on the data binary Only report results for the class specified by poslabel This is applicable only if targets ytrue ypred are binary

micro Calculate metrics globally by counting the total true positives false negatives and false positives

macro Calculate metrics for each label and find their unweighted mean This does not take label imbalance into account

weighted Calculate metrics for each label and find their average weighted by support the number of true instances for each label This alters 'macro' to account for label imbalance it can result in an Fscore that is not between precision and recall

samples Calculate metrics for each instance and find their average only meaningful for multilabel classification where this differs from accuracy score

sampleweight arraylike of shape nsamples optional Sample weights

Returns

f1score float or array of float shape nunique labels F1 score of the positive class in binary classification or weighted average of the F1 scores of each class for the multiclass task

•Probability Calibration curves

sklearn.metrics.fbeta_score

sklearn.metrics.fbeta_score(ytrue, ypred, beta=1, labels=None, pos_label=1, average='binary')

sample_weight=None

Compute the Fbeta score

The Fbeta score is the weighted harmonic mean of precision and recall reaching its optimal value at 1 and its worst value at 0

The beta parameter determines the weight of recall in the combined score: beta = 1 lends more weight to precision while beta = 1 favors recall. beta = 0 considers only precision, beta = inf only recall.

Read more in the User Guide

Parameters

ytrue 1d array-like or label indicator array, sparse matrix Ground truth (correct) target values

ypred 1d array-like or label indicator array, sparse matrix Estimated targets as returned by a classifier

beta float Weight of precision in harmonic mean

labels list optional The set of labels to include when average = 'binary' and their

order if average is None. Labels present in the data can be excluded, for example to

calculate a multiclass average ignoring a majority negative class while labels not present in

624 sklearn.metrics Metrics 1997

scikitlearn user guide Release 0213

the data will result in 0 components in a macro average For multilabel targets labels are column indices By default all labels in ytrue andypred are used in sorted order

Changed in version 017 parameter labels improved for multiclass problem

poslabel str or int 1 by default The class to report if averagebinary and the data is binary If the data are multiclass or multilabel this will be ignored setting labelsposlabel andaverage binary will report scores for that label only

array071 0 0
sklearnmetrics hammingloss
sklearnmetrics hammingloss ytrue ypred labelsNone sampleweightNone
Compute the average Hamming loss
The Hamming loss is the fraction of labels that are incorrectly predicted
Read more in the User Guide
Parameters
ytrue 1d arraylike or label indicator array sparse matrix Ground truth correct labels
ypred 1d arraylike or label indicator array sparse matrix Predicted labels as returned by
a classifier
labels array shape nlabels optional default'deprecated' Integer array of labels If not
provided labels will be inferred from ytrue and ypred
New in version 018
Deprecated since version 021 This parameter labels is deprecated in version 021 and
will be removed in version 023 Hamming loss uses ytrueshape1 for the number
of labels when ytrue is binary label indicators so it is unnecessary for the user to specify
sampleweight arraylike of shape nsamples optional Sample weights
New in version 018
Returns
loss float or int Return the average Hamming loss between element of ytrue andypred
See also
accuracy score jaccardscore zeroone loss
Notes
In multiclass classification the Hamming loss corresponds to the Hamming distance between ytrue and
ypred which is equivalent to the subset zeroone loss function when normalize parameter is set to
True
In multilabel classification the Hamming loss is different from the subset zeroone loss The zeroone loss
considers the entire set of labels for a given sample incorrect if it does not entirely match the true set of labels
Hamming loss is more forgiving in that it penalizes only the individual labels
624sklearnmetrics Metrics 1999

scikitlearn user guide Release 0.21.3

The Hamming loss is upperbounded by the subset zero-one loss when normalize parameter is set to True. It is always between 0 and 1, lower being better.

•Model Complexity Influence

```
sklearn.metrics.hinge_loss
```

```
sklearn.metrics.hinge_loss(y_true, pred_decision, labels=None, sample_weight=None)
```

Average hinge loss, nonregularized

In binary class case assuming labels in y_true are encoded with 1 and -1 when a prediction mistake is

made, margin = y_true * pred_decision is always negative since the signs disagree, implying

margin is always greater than -1. The cumulated hinge loss is therefore an upper bound of the number of mistakes made by the classifier.

In multiclass case the function expects that either all the labels are included in y_true or an optional labels

argument is provided which contains all the labels. The multilabel margin is calculated according to Crammer

Singer's method. As in the binary case the cumulated hinge loss is an upper bound of the number of mistakes

made by the classifier.

Read more in the User Guide

Parameters

y_true: array, shape (n_samples,) True target consisting of integers of two values. The

positive label must be greater than the negative label.

pred_decision: array, shape (n_samples,) or (n_samples, n_classes). Predicted decisions as

output by decision function. floats.

labels: array, optional, default None. Contains all the labels for the problem. Used in multiclass

hinge loss.

sample_weight: array-like of shape (n_samples,) optional. Sample weights.

Compute the Matthews correlation coefficient MCC

The Matthews correlation coefficient is used in machine learning as a measure of the quality of binary and multiclass classifications It takes into account true and false positives and negatives and is generally regarded as a balanced measure which can be used even if the classes are of very different sizes The MCC is in essence a correlation coefficient value between -1 and 1 A coefficient of 1 represents a perfect prediction 0 an average

sklearnmetrics precisionrecallcurve

sklearnmetrics precisionrecallcurve ytrue probaspred poslabelNone sam
pleweightNone

Compute precisionrecall pairs for different probability thresholds

Note this implementation is restricted to the binary classification task

The precision is the ratio $\frac{tp}{tp + fp}$ where tp is the number of true positives and fp the number of false positives The precision is intuitively the ability of the classifier not to label as positive a sample that is negative

The recall is the ratio $\frac{tp}{tp + fn}$ where tp is the number of true positives and fn the number of false negatives The recall is intuitively the ability of the classifier to find all the positive samples

The last precision and recall values are 1 and 0 respectively and do not have a corresponding threshold This ensures that the graph starts on the y axis

Read more in the User Guide

Parameters

ytrue array shape nsamples True binary labels If labels are not either 1 1 or 0 1 then poslabel should be explicitly given

probaspred array shape nsamples Estimated probabilities or decision function
poslabel int or str defaultNone The label of the positive class When poslabelNone

if ytrue is in 1 1 or 0 1 poslabel is set to 1 otherwise an error will be raised
sampleweight arraylike of shape nsamples optional Sample weights

Returns

precision array shape nthresholds 1 Precision values such that element i is the precision of predictions with score thresholds[i] and the last element is 1

recall array shape nthresholds 1 Decreasing recall values such that element i is the recall of predictions with score thresholds[i] and the last element is 0

thresholds array shape nthresholds lennpuniqueprobaspred Increasing thresholds on the decision function used to compute precision and recall

Parameters

ytrue 1d arraylike or label indicator array sparse matrix Ground truth correct target values

ypred 1d arraylike or label indicator array sparse matrix Estimated targets as returned by a classifier

beta float 10 by default The strength of recall versus precision in the Fscore

labels list optional The set of labels to include when average binary and their order ifaverage is None Labels present in the data can be excluded for example to calculate a multiclass average ignoring a majority negative class while labels not present in the data will result in 0 components in a macro average For multilabel targets labels are column indices By default all labels in ytrue andypred are used in sorted order

2008 Chapter 6 API (Application Programming Interface) Reference

scikitlearn user guide Release 0213

poslabel str or int 1 by default The class to report if averagebinary and the data is binary If the data are multiclass or multilabel this will be ignored setting labelsposlabel andaverage binary will report scores for that la

bel only

average string None default 'binary' 'micro' 'macro' 'samples' 'weighted' If None the scores for each class are returned Otherwise this determines the type of averaging performed on the data

binary Only report results for the class specified by poslabel This is applicable

only if targets ytruepred are binary

micro Calculate metrics globally by counting the total true positives false negatives and false positives

macro Calculate metrics for each label and find their unweighted mean This does not take label imbalance into account

weighted Calculate metrics for each label and find their average weighted by support the number of true instances for each label This alters 'macro' to account for label imbalance it can result in an Fscore that is not between precision and recall

samples Calculate metrics for each instance and find their average only meaningful for multilabel classification where this differs from accuracyscore

warnfor tuple or set for internal use This determines which warnings will be made in the case that this function is being used to return only one of its metrics

sampleweight arraylike of shape nsamples optional Sample weights

Returns

precision float if average is not None or array of float shape nuniquelabels

recall float if average is not None or array of float shape nuniquelabels

fbetascore float if average is not None or array of float shape nuniquelabels

support int if average is not None or array of int shape nuniquelabels The number of occurrences of each label in ytrue

Notes

Whenttrue positive false positive 0 precision is undefined When true positive

false negative 0 recall is undefined In such cases the metric will be set to 0 as will fscore

andUndefinedMetricWarning will be raised

624sklearn.metrics Metrics 2011

scikitlearn user guide Release 0213

sklearnmetrics recallscore

sklearnmetrics recallscore ytrue ypred labelsNone poslabel1 average'binary' sampleweightNone

Compute the recall

The recall is the ratio $\frac{tp}{tp + fn}$ where tp is the number of true positives and fn the number of false negatives. The recall is intuitively the ability of the classifier to find all the positive samples. The best value is 1 and the worst value is 0.

Read more in the User Guide

Parameters

ytrue 1d arraylike or label indicator array sparse matrix Ground truth correct target values

ypred 1d arraylike or label indicator array sparse matrix Estimated targets as returned by a classifier

labels list optional The set of labels to include when average 'binary' and their order if average is None. Labels present in the data can be excluded for example to calculate a multiclass average ignoring a majority negative class while labels not present in the data will result in 0 components in a macro average. For multilabel targets labels are column indices. By default all labels in ytrue and ypred are used in sorted order.

Changed in version 0.17 parameter labels improved for multiclass problem.
poslabel str or int 1 by default The class to report if average 'binary' and the data is binary. If the data are multiclass or multilabel this will be ignored setting labelsposlabel and average 'binary' will report scores for that label only.

average string None 'binary' default 'micro' 'macro' 'samples' 'weighted' This parameter is required for multiclass/multilabel targets. If None the scores for each class are returned. Otherwise this determines the type of averaging performed on the data: 'binary' Only report results for the class specified by poslabel. This is applicable only if targets ytrue/ypred are binary.

'micro' Calculate metrics globally by counting the total true positives, false negatives and false positives.

'macro' Calculate metrics for each label and find their unweighted mean. This does not take label imbalance into account.

'weighted' Calculate metrics for each label and find their average weighted by support the number of true instances for each label. This alters 'macro' to account for label imbalance. It can result in an F-score that is not between precision and recall.

'samples' Calculate metrics for each instance and find their average (only meaningful for multilabel classification where this differs from accuracy score).

sampleweight arraylike of shape (n_samples,) optional Sample weights

Returns

recall float if average is not None or array of float shape (n_unique_labels,) Recall of the positive class in binary classification or weighted average of the recall of each class for the multiclass task.

Compute Area Under the Receiver Operating Characteristic Curve ROC AUC from prediction scores

Note this implementation is restricted to the binary classification task or multilabel classification task in label

indicator format

Read more in the User Guide

Parameters

y_true array shape (n_samples) or (n_samples, n_classes) True binary labels or binary label

indicators

y_score array shape (n_samples) or (n_samples, n_classes) Target scores can either be probability estimates of the positive class confidence values or nonthresholded measure of decisions as returned by “decision_function” on some classifiers For binary y_true

y_score is supposed to be the score of the class with greater label

average string None ‘micro’ ‘macro’ default ‘samples’ ‘weighted’ If None the scores

for each class are returned Otherwise this determines the type of averaging performed on the data

micro Calculate metrics globally by considering each element of the label indicator matrix as a label

624sklearn.metrics Metrics 2013

scikitlearn user guide Release 0.21.3

macro Calculate metrics for each label and find their unweighted mean. This does not take label imbalance into account.

weighted Calculate metrics for each label and find their average weighted by support the number of true instances for each label.

samples Calculate metrics for each instance and find their average.

Will be ignored when ytrue is binary.

sampleweight arraylike of shape (n_samples,) optional Sample weights

maxfpr float, 0 and 1 optional If not None, the standardized partial AUC over the range [0, maxfpr] is returned.

Returns

auc float

```

```
sklearn.metrics.roc_curve
```

```
sklearn.metrics.roc_curve(ytrue, yscore, poslabel=None, sampleweight=None,
```

```
dropintermediate=True)
```

Compute Receiver operating characteristic (ROC)

Note this implementation is restricted to the binary classification task.

Read more in the User Guide.

Parameters

ytrue array, shape (n_samples,) True binary labels. If labels are not either 1 or 0, 1

then poslabel should be explicitly given.

yscore array, shape (n_samples,) Target scores can either be probability estimates of the positive class confidence values or nonthresholded measure of decisions as returned by "decisionfunction" on some classifiers.

poslabel int or str, default=None The label of the positive class. When poslabel=None

if ytrue is in [1, 1] or [0, 1] poslabel is set to 1, otherwise an error will be raised.

2014 Chapter 6 API (Application Programming Interface) Reference

scikitlearn user guide Release 0213

sampleweight arraylike of shape nsamples optional Sample weights
dropintermediate boolean optional defaultTrue Whether to drop some suboptimal
thresholds which would not appear on a plotted ROC curve This is useful in order to
create lighter ROC curves

New in version 017 parameter dropintermediate

Returns

fprarray shape 2 Increasing false positive rates such that element i is the false positive
rate of predictions with score thresholdsi

tprarray shape 2 Increasing true positive rates such that element i is the true positive
rate of predictions with score thresholdsi

thresholds array shape nthresholds Decreasing thresholds on the decision function used
to compute fpr and tpr thresholds0 represents no instances being predicted and is
arbitrarily set to maxyscore 1

See also

rocaucscore Compute the area under the ROC curve

Notes

Since the thresholds are sorted from low to high values they are reversed upon returning them to ensure they
correspond to both fpr andtpr which are sorted in reversed order during their calculation

sklearnmetrics r2score

sklearnmetrics r2score ytrue ypred sampleweightNone multioutput'uniformaverage'

R2 coefficient of determination regression score function

Best possible score is 10 and it can be negative because the model can be arbitrarily worse A constant model that always predicts the expected value of y disregarding the input features would get a R2 score of 00

Read more in the User Guide

Parameters

ytrue arraylike of shape nsamples or nsamples noutputs Ground truth correct target values

ypred arraylike of shape nsamples or nsamples noutputs Estimated target values

sampleweight arraylike of shape nsamples optional Sample weights

multioutput string in 'rawvalues' 'uniformaverage' 'varianceweighted' or None or

arraylike of shape noutputs Defines aggregating of multiple output scores Arraylike

value defines weights used to average scores Default is "uniformaverage"

'rawvalues' Returns a full set of scores in case of multioutput input

'uniformaverage' Scores of all outputs are averaged with uniform weight

'varianceweighted' Scores of all outputs are averaged weighted by the variances of each individual output

Changed in version 019 Default value of multioutput is 'uniformaverage'

Returns

zfloat or ndarray of floats The R2 score or ndarray of scores if 'multioutput' is 'rawvalues'

Notes

This is not a symmetric function

Unlike most other scores R2 score may be negative it need not actually be the square of a quantity R

This metric is not welldefined for single samples and will return a NaN value if nsamples is less than two

6244 Multilabel ranking metrics

See the Multilabel ranking metrics section of the user guide for further details

metricscoverageerror ytrue yscore Coverage error measure

metricslabelrankingaverageprecisionscore Compute rankingbased average precision

metricslabelrankingloss ytrue yscore Compute Ranking loss measure

sklearnmetrics coverageerror

sklearnmetrics coverageerror ytrue yscore sampleweightNone

Coverage error measure

Compute how far we need to go through the ranked scores to cover all true labels The best value is equal to the

average number of labels in ytrue per sample

Ties inyscores are broken by giving maximal rank that would have been assigned to all tied values

Note Our implementation’s score is 1 greater than the one given in Tsoumakas et al 2010 This extends it to

handle the degenerate case in which an instance has 0 true labels

Read more in the User Guide

Parameters

ytrue array shape nsamples nlabels True binary labels in binary indicator format

yscore array shape nsamples nlabels Target scores can either be probability esti

mates of the positive class confidence values or nonthresholded measure of decisions as

returned by “decisionfunction” on some classifiers

sampleweight arraylike of shape nsamples optional Sample weights

Returns

624sklearnmetrics Metrics 2023

scikitlearn user guide Release 0213

coverageerror float

References

1

sklearnmetrics labelrankingaverageprecisionscore

sklearnmetrics labelrankingaverageprecisionscore ytrue yscore sampleweightNone

Compute rankingbased average precision

Label ranking average precision LRAP is the average over each ground truth label assigned to each sample of the ratio of true vs total labels with lower score

This metric is used in multilabel ranking problem where the goal is to give better rank to the labels associated to each sample

The obtained score is always strictly greater than 0 and the best value is 1

Read more in the User Guide

Parameters

ytrue array or sparse matrix shape nsamples nlabels True binary labels in binary indicator format

yscore array shape nsamples nlabels Target scores can either be probability estimates of the positive class confidence values or nonthresholded measure of decisions as returned by “decisionfunction” on some classifiers

sampleweight arraylike of shape nsamples optional Sample weights

Returns

score float

Examples

```
import numpy as np
from sklearnmetrics import labelrankingaverageprecisionscore
```

```
ytrue nparray1 0 0 0 0 1

sklearnmetrics adjustedmutualinfoscore

sklearnmetrics adjustedmutualinfoscore labelstrue labelspred aver
agemethod'warn'

Adjusted Mutual Information between two clusterings

Adjusted Mutual Information AMI is an adjustment of the Mutual Information MI score to account for chance It accounts for the fact that the MI is generally higher for two clusterings with a larger number of clusters regardless of whether there is actually more information shared For two clusterings \mathcal{C}_1 and \mathcal{C}_2 the AMI is given as

$$AMI(\mathcal{C}_1, \mathcal{C}_2) = \frac{MI(\mathcal{C}_1, \mathcal{C}_2) - \frac{1}{2}MI(\mathcal{C}_1, \mathcal{C}_1) - \frac{1}{2}MI(\mathcal{C}_2, \mathcal{C}_2)}{1 - \frac{1}{2}MI(\mathcal{C}_1, \mathcal{C}_1) - \frac{1}{2}MI(\mathcal{C}_2, \mathcal{C}_2)}$$

This metric is independent of the absolute values of the labels a permutation of the class or cluster label values won't change the score value in any way

This metric is furthermore symmetric switching labeltrue withlabelpred will return the same score value This can be useful to measure the agreement of two independent label assignments strategies on the same dataset when the real ground truth is not known

Be mindful that this function is an order of magnitude slower than other metrics such as the Adjusted Rand Index

Read more in the User Guide

Parameters

labelstrue int array shape nsamples A clustering of the data into disjoint subsets

labelspred array shape nsamples A clustering of the data into disjoint subsets

averagemethod string optional default 'warn' How to compute the normalizer in the denominator Possible options are 'min' 'geometric' 'arithmetic' and 'max' If 'warn' 'max' will be used The default will change to 'arithmetic' in version 022

New in version 020

Returns

ami float upperlimited by 10 The AMI returns a value of 1 when the two partitions are identical ie perfectly matched Random partitions independent labellings have an expected AMI around 0 on average hence can be negative

sklearnmetrics adjustedrandscore labelstrue labelspred
Rand index adjusted for chance
```

The Rand Index computes a similarity measure between two clusterings by considering all pairs of samples and counting pairs that are assigned in the same or different clusters in the predicted and true clusterings

The raw RI score is then “adjusted for chance” into the ARI score using the following scheme

```
ARI RI ExpectedRI maxRI ExpectedRI
The adjusted Rand index is thus ensured to have a value close to 00 for random labeling independently of the
number of clusters and samples and exactly 10 when the clusterings are identical up to a permutation
```

```
ARI is a symmetric measure

sklearnmetricscluster contingencymatrix

sklearnmetricscluster contingencymatrix labelstrue labelspred epsNone
sparseFalse

Build a contingency matrix describing the relationship between labels

Parameters

labelstrue int array shape nsamples Ground truth class labels to be used as a reference

labelspred array shape nsamples Cluster labels to evaluate

eps None or float optional If a float that value is added to all values in the contingency

matrix This helps to stop NaN propagation If None nothing is adjusted

sparse boolean optional If True return a sparse CSR (Compressed Sparse Row) continency matrix If eps is not
None andsparse is True will throw ValueError

New in version 018

Returns

contingency arraylike sparse shapenclassestrue nclassespred Matrix such that

is the number of samples in true class and in predicted class Ifeps is None

the dtype of this array will be integer If eps is given the dtype will be float Will be a

scipysparsecsrmatrix ifsparseTrue

sklearnmetrics fowlkesmallowsscore

sklearnmetrics fowlkesmallowsscore labelstrue labelspred sparseFalse

Measure the similarity of two clusterings of a set of points

The FowlkesMallows index FMI is defined as the geometric mean between of the precision and recall

$FMI = \frac{TP}{\sqrt{TP + FP}} \cdot \frac{TP}{\sqrt{TP + FN}}$

WhereTPis the number of True Positive ie the number of pair of points that belongs in the same clusters

in bothlabelstrue andlabelspred FPis the number of False Positive ie the number of pair of

points that belongs in the same clusters in labelstrue and not inlabelspred andFNis the number

ofFalse Negative ie the number of pair of points that belongs in the same clusters in labelspred and not
inlabelsTrue

The score ranges from 0 to 1 A high value indicates a good similarity between two clusters

Read more in the User Guide

Parameters

labelstrue int array shape nsamples A clustering of the data into disjoint subsets

labelspred array shape nsamples A clustering of the data into disjoint subsets

sparse bool Compute contingency matrix internally with sparse matrix

beta10

Compute the homogeneity and completeness and VMeasure scores at once

Those metrics are based on normalized conditional entropy measures of the clustering labeling to evaluate given the knowledge of a Ground Truth class labels of the same samples

A clustering result satisfies homogeneity if all of its clusters contain only data points which are members of a single class

A clustering result satisfies completeness if all the data points that are members of a given class are elements of the same cluster

Both scores have positive values between 00 and 10 larger values being desirable

Those 3 metrics are independent of the absolute values of the labels a permutation of the class or cluster label values won't change the score values in any way

VMeasure is furthermore symmetric swapping labelstrue andlabelpred will give the same score This does not hold for homogeneity and completeness VMeasure is identical to normalizedmutualinfoscore with the arithmetic averaging method

Read more in the User Guide

Parameters

sklearnmetrics.mutual_info_score
sklearnmetrics.mutual_info_score(label_true, label_pred, contingency=None)
Mutual Information between two clusterings
The Mutual Information is a measure of the similarity between two labels of the same data. Where n_i is the number of the samples in cluster i and m_j is the number of the samples in cluster j , the Mutual Information between clusterings \mathcal{A} and \mathcal{B} is given as

$$MI(\mathcal{A}, \mathcal{B}) = \frac{1}{n} \sum_{i,j} \log \frac{n_{ij} n}{n_i n_j}$$

This metric is independent of the absolute values of the labels: a permutation of the class or cluster label values won't change the score value in any way.

This metric is furthermore symmetric: switching label_true with label_pred will return the same score value. This can be useful to measure the agreement of two independent label assignments strategies on the same dataset when the real ground truth is not known.

Read more in the User Guide

Parameters
label_true: int array shape (n_samples,) A clustering of the data into disjoint subsets
label_pred: array shape (n_samples,) A clustering of the data into disjoint subsets
contingency: None array sparse matrix shape (n_classes_true, n_classes_pred) A contingency matrix given by the contingency_matrix function. If value is None, it will be computed otherwise the given value is used with label_true and label_pred.
ignored

Returns

sklearnmetrics silhouette_score
sklearnmetrics silhouette_score Xlabels metric'euclidean' samplesizeNone ran
domstateNone kwds
Compute the mean Silhouette Coefficient of all samples
The Silhouette Coefficient is calculated using the mean intracluster distance a and the mean nearestcluster distance b for each sample The Silhouette Coefficient for a sample is $b - a / \max(a, b)$ To clarify b is the distance between a sample and the nearest cluster that the sample is not a part of Note that Silhouette Coefficient is only defined if number of labels is $2 \leq n_{\text{labels}} \leq n_{\text{samples}}$
This function returns the mean Silhouette Coefficient over all samples To obtain the values for each sample use `silhouette_samples`
The best value is 1 and the worst value is -1 Values near 0 indicate overlapping clusters Negative values generally indicate that a sample has been assigned to the wrong cluster as a different cluster is more similar
Read more in the User Guide

Parameters
Xarray `nsamples`a if `metric` "precomputed" or `nsamples`a
`nfeatures` otherwise Array of pairwise distances between samples or a feature array
`labels` array shape `(n_samples)` Predicted labels for each sample
`metric` string or callable The metric to use when calculating distance between instances in a feature array If `metric` is a string it must be one of the options allowed by `metrics.pairwise_distances` If `X` is the distance array itself use `metric=precomputed`
`samplesize` int or None The size of the sample to use when computing the Silhouette Coefficient on a random subset of the data If `samplesize` is None no sampling is used
`randomstate` int RandomState instance or None optional defaultNone The generator used to randomly select a subset of samples If int `randomstate` is the seed used by the random number generator If RandomState instance `randomstate` is the random number generator If None the random number generator is the RandomState instance used by `np.random` Used when `samplesize` is not None
`kwds` optional keyword parameters Any further parameters are passed directly to the distance function If using a `scipy.spatial.distance` metric the parameters are still metric dependent See the `scipy` docs for usage examples
Returns
`silhouette` float Mean Silhouette Coefficient for all samples
2036 Chapter 6 API (Application Programming Interface) Reference

- Clustering text documents using kmeans

sklearnmetrics.silhouettesamples

sklearnmetrics.silhouettesamples(Xlabels, metric='euclidean', kwds

Compute the Silhouette Coefficient for each sample

The Silhouette Coefficient is a measure of how well samples are clustered with samples that are similar to themselves. Clustering models with a high Silhouette Coefficient are said to be dense where samples in the same cluster are similar to each other and well separated where samples in different clusters are not very similar to each other.

The Silhouette Coefficient is calculated using the mean intracluster distance a and the mean nearestcluster distance b for each sample. The Silhouette Coefficient for a sample is $b - a / \max(a, b)$. Note that

Silhouette Coefficient is only defined if number of labels is $2 \leq n_{\text{labels}} \leq n_{\text{samples}} - 1$.

This function returns the Silhouette Coefficient for each sample.

The best value is 1 and the worst value is -1. Values near 0 indicate overlapping clusters.

Read more in the User Guide.

Parameters

X: array of shape (n_samples, n_features) or (n_samples, n_features) if metric="precomputed" or n_samples

n_features: otherwise Array of pairwise distances between samples or a feature array

labels: array of shape (n_samples,) label values for each sample

metric: string or callable. The metric to use when calculating distance between instances in

a feature array. If metric is a string it must be one of the options allowed by sklearn

metrics.pairwise_distances. If X is the distance array itself use

"precomputed" as the metric.

'kwds': optional keyword parameters. Any further parameters are passed directly to the dis

tance function. If using a scipy.spatial.distance metric the parameters are still

metric dependent. See the scipy docs for usage examples.

Returns

silhouette: array of shape (n_samples,) Silhouette Coefficient for each sample.

`sklearn.metrics.pairwise.chi2kernel`

`sklearn.metrics.pairwise.chi2kernel(X, Y, None, gamma=10)`

Computes the exponential chisquared kernel X and Y

The chisquared kernel is computed between each pair of rows in X and Y X and Y have to be nonnegative

This kernel is most commonly applied to histograms

The chisquared kernel is given by

$$k(x, y) = \exp(\gamma \sum_i x_i^2 - x_i y_i)$$

It can be interpreted as a weighted difference per entry

Read more in the User Guide

Parameters

Xarraylike of shape `(n_samples, n_features)`

Yarray of shape `(n_samples, n_features)`

gamma float default=1 Scaling parameter of the chi2 kernel

Returns

kernelmatrix array of shape `(n_samples, n_samples)`

See also

`additivechi2kernel` The additive version of this kernel

`sklearn.kernel_approximation.AdditiveChi2Sampler` A Fourier approximation to the additive version of this kernel

sklearnmetricspairwise euclidean

sklearnmetricspairwise euclidean X=None Y=None squared=False Xnormsquared=None

squared=False Xnormsquared=None

Considering the rows of X and Y as vectors compute the distance matrix between each pair of vectors

For efficiency reasons the euclidean distance between a pair of row vector x and y is computed as

$\sqrt{\sum (x_i - y_i)^2}$

This formulation has two advantages over other ways of computing distances First it is computationally efficient when dealing with sparse data Second if one argument varies but the other remains unchanged then

$\sum x_i^2$ and $\sum y_i^2$ can be precomputed

However this is not the most precise way of doing this computation and the distance matrix returned by this

function may not be exactly symmetric as required by eg scipyspatialdistance functions

Read more in the User Guide

Parameters

Xarraylike sparse matrix shape (n_samples1, n_features)

Yarraylike sparse matrix shape (n_samples2, n_features)

Ynormsquared arraylike shape (n_samples2,) optional Precomputed dotproducts of

vectors in Y eg $\sum y_i^2$ May be ignored in some cases see the note

below

squared boolean optional Return squared Euclidean distances

Xnormsquared arraylike shape (n_samples1,) optional Precomputed dotproducts of

vectors in X eg $\sum x_i^2$ May be ignored in some cases see the note

below

Returns

distances array shape (n_samples1, n_samples2)

sklearnmetricspairwise haversine

sklearnmetricspairwise haversine XYNone

Compute the Haversine distance between samples in X and Y

The Haversine or great circle distance is the angular distance between two points on the surface of a sphere

The first distance of each point is assumed to be the latitude the second is the longitude given in radians The

dimension of the data must be 2

$$d = 2 \arcsin \sqrt{\sin^2 \frac{\phi_1 - \phi_2}{2} + \cos \phi_1 \cos \phi_2 \sin^2 \frac{\lambda_1 - \lambda_2}{2}}$$

Parameters

Xarraylike shape nsamples1 2

Yarraylike shape nsamples2 2 optional

Returns

distance array shape nsamples1 nsamples2

Notes

As the Earth is nearly spherical the haversine formula provides a good approximation of the distance between

two points of the Earth surface with a less than 1 error on average

Examples

We want to calculate the distance between the Ezeiza Airport Buenos Aires Argentina and the Charles de

Gaulle Airport Paris France

Parameters

Xndarray nsamples nfeatures Array 1 for distance computation
Yndarray nsamples nfeatures Array 2 for distance computation
metric string or callable The metric to use when calculating distance between instances in a feature array If metric is a string it must be one of the options specified in PAIREDDISTANCES including "euclidean" "manhattan" or "cosine" Alternatively if metric is a callable function it is called on each pair of instances rows and the resulting value recorded The callable should take two arrays from X as input and return a value indicating the distance between them

Returns

distances ndarray nsamples

See also

pairwisedistances Computes the distance between every pair of samples

Examples

from sklearnmetricspairwise import paireddistances

X 0 1 1 1

Y 0 1 2 1

paireddistancesX Y

array0 1

sklearnmetrics pairwisedistances

sklearnmetrics pairwisedistances XYNone metric'euclidean' njobsNone kwds

Compute the distance matrix from a vector array X and optional Y

This method takes either a vector array or a distance matrix and returns a distance matrix If the input is a vector array the distances are computed If the input is a distances matrix it is returned instead

This method provides a safe way to take a distance matrix as input while preserving compatibility with many other algorithms that take a vector array

If Y is given default is None then the returned matrix is the pairwise distance between the arrays from both X and Y

scikitlearn user guide Release 0213

Valid values for metric are

- From scikitlearn ‘cityblock’ ‘cosine’ ‘euclidean’ ‘l1’ ‘l2’ ‘manhattan’ These metrics support sparse matrix inputs
- From scipyspatialdistance ‘braycurtis’ ‘canberra’ ‘chebyshev’ ‘correlation’ ‘dice’ ‘hamming’ ‘jaccard’ ‘kulsinski’ ‘mahalanobis’ ‘minkowski’ ‘rogerstanimoto’ ‘russellrao’ ‘seuclidean’ ‘sokalmichener’ ‘sokalsneath’ ‘sqeuclidean’ ‘yule’ See the documentation for scipyspatialdistance for details on these metrics These metrics do not support sparse matrix inputs

Note that in the case of ‘cityblock’ ‘cosine’ and ‘euclidean’ which are valid scipyspatialdistance metrics the scikitlearn implementation will be used which is faster and has support for sparse matrices except for ‘cityblock’ For a verbose description of the metrics from scikitlearn see the doc of the sklearnpairwiselocalmetrics function

Read more in the User Guide

Parameters

Xarray nsamplesa nsamplesa if metric “precomputed” or nsamplesa

nfeatures otherwise Array of pairwise distances between samples or a feature array

Yarray nsamplesb nfeatures optional An optional second feature array Only allowed if metric “precomputed”

metric string or callable The metric to use when calculating distance between instances in a feature array If metric is a string it must be one of the options allowed by scipyspatialdistancepairwise for its metric parameter or a metric listed in pairwisePAIRWISEDISTANCEFUNCTIONS If metric is “precomputed” X is assumed to be a distance matrix Alternatively if metric is a callable function it is called on each pair of instances rows and the resulting value recorded The callable should take two arrays from X as input and return a value indicating the distance between them

njobs int or None optional defaultNone The number of jobs to use for the computation

This works by breaking down the pairwise matrix into njobs even slices and computing them in parallel

None means 1 unless in a joblibparallelbackend context1means using all processors See Glossary for more details

kwds optional keyword parameters Any further parameters are passed directly to the distance function If using a scipyspatialdistance metric the parameters are still metric dependent See the scipy docs for usage examples

Returns

Darray nsamplesa nsamplesa or nsamplesa nsamplesb A distance matrix D

such that D_{ij} is the distance between the i th and j th vectors of the given matrix X if Y is None If Y is not None then D_{ij} is the distance between the i th array from X and the j th array from Y

Variational Bayesian estimation of a Gaussian mixture

This class allows to infer an approximate posterior distribution over the parameters of a Gaussian mixture

distribution The effective number of components can be inferred from the data

This class implements two types of prior for the weights distribution a finite mixture model with Dirichlet

distribution and an infinite mixture model with the Dirichlet Process In practice Dirichlet Process inference

algorithm is approximated and uses a truncated distribution with a fixed maximum number of components

called the Stickbreaking representation The number of components actually used almost always depends on

the data

New in version 018

Read more in the User Guide

Parameters

ncomponents int defaults to 1 The number of mixture components Depending on the data

and the value of the weightconcentrationprior the model can decide to not use

all the components by setting some component weights to values very close to zero

The number of effective components is therefore smaller than ncomponents

covariancetype 'full' 'tied' 'diag' 'spherical' defaults to 'full' String describing the

type of covariance parameters to use Must be one of

full each component has its own general covariance matrix

tied all components share the same general covariance matrix

diag each component has its own diagonal covariance matrix

spherical each component has its own single variance

tolfloat defaults to 1e3 The convergence threshold EM iterations will stop when the lower

bound average gain on the likelihood of the training data with respect to the model is below

this threshold

regcovar float defaults to 1e6 Nonnegative regularization added to the diagonal of co

variance Allows to assure that the covariance matrices are all positive

maxiter int defaults to 100 The number of EM iterations to perform

625sklearnmixture Gaussian Mixture Models 2057

scikitlearn user guide Release 0213

ninit int defaults to 1 The number of initializations to perform The result with the highest lower bound value on the likelihood is kept

initparams ‘kmeans’ ‘random’ defaults to ‘kmeans’ The method used to initialize the weights the means and the covariances Must be one of

kmeans responsibilities are initialized using kmeans

random responsibilities are initialized randomly

weightconcentrationpriortype str defaults to ‘dirichletprocess’ String describing the type of the weight concentration prior Must be one of

dirichletprocess using the Stickbreaking representation

dirichletdistribution can favor more uniform weights

weightconcentrationprior float None optional The dirichlet concentration of each component on the weight distribution Dirichlet This is commonly called gamma in the literature The higher concentration puts more mass in the center and will lead to more components being active while a lower concentration parameter will lead to more mass at the edge of the mixture weights simplex The value of the parameter must be greater than 0 If it is None it’s set to 1 ncomponents

meanprecisionprior float None optional The precision prior on the mean distribution Gaussian Controls the extend to where means can be placed Larger values concentrate the means of each clusters around meanprior The value of the parameter must be greater than 0 If it is None it’s set to 1

meanprior arraylike shape nfeatures optional The prior on the mean distribution Gaussian If it is None it’s set to the mean of X

degreesoffreedomprior float None optional The prior of the number of degrees of freedom on the covariance distributions Wishart If it is None it’s set to nfeatures

covarianceprior float or arraylike optional The prior on the covariance distribution Wishart If it is None the emiprical covariance prior is initialized using the covariance of X The shape depends on covariancetype

nfeatures nfeatures iffull

nfeatures nfeatures iftied

nfeatures ifdiag

float ifspherical

randomstate int RandomState instance or None optional defaultNone If int randomstate is the seed used by the random number generator If RandomState instance randomstate is the random number generator If None the random number generator is the RandomState instance used by nprandom

warmstart bool default to False If ‘warmstart’ is True the solution of the last fitting is used as initialization for the next call of fit This can speed up convergence when fit is called several times on similar problems See the Glossary

verbose int default to 0 Enable verbose output If 1 then it prints the current initialization and each iteration step If greater than 1 then it prints also the log probability and the time needed for each step

verboseinterval int default to 10 Number of iteration done before the next print

Attributes

weights arraylike shape ncomponents The weights of each mixture components

2058 Chapter 6 API (Application Programming Interface) Reference

fitselfXyNone

Estimate model parameters with the EM algorithm

2060 Chapter 6 API (Application Programming Interface) Reference

scikitlearn user guide Release 0213

The method fits the model ninit times and sets the parameters with which the model has the largest likelihood or lower bound Within each trial the method iterates between Estep and Mstep for maxiter times until the change of likelihood or lower bound is less than tol otherwise a ConvergenceWarning is raised If warmstart isTrue then ninit is ignored and a single initialization is performed upon the first call Upon consecutive calls training starts where it left off

Parameters

Xarraylike shape nsamples nfeatures List of nfeaturesdimensional data points

Each row corresponds to a single data point

Returns

self

fitpredict selfXyNone

Estimate model parameters using X and predict the labels for X

The method fits the model ninit times and sets the parameters with which the model has the largest likelihood or lower bound Within each trial the method iterates between Estep and Mstep for maxiter times until the change of likelihood or lower bound is less than tol otherwise a ConvergenceWarning is raised After fitting it predicts the most probable label for the input data points

New in version 020

Parameters

Xarraylike shape nsamples nfeatures List of nfeaturesdimensional data points

Each row corresponds to a single data point

Returns

labels array shape nsamples Component labels

getparams selfdeepTrue

Get parameters for this estimator

Parameters

deep boolean optional If True will return the parameters for this estimator and contained

subobjects that are estimators

Returns

params mapping of string to any Parameter names mapped to their values

predictselfX

Predict the labels for the data samples in X using trained model

Parameters

Xarraylike shape nsamples nfeatures List of nfeaturesdimensional data points

Each row corresponds to a single data point

Returns

labels array shape nsamples Component labels

predictproba selfX

Predict posterior probability of each component given the data

Parameters

Xarraylike shape nsamples nfeatures List of nfeaturesdimensional data points

Each row corresponds to a single data point

625sklearnmixture Gaussian Mixture Models 2061

scikitlearn user guide Release 0213

Returns

resp array shape nsamples ncomponents Returns the probability each Gaussian state in the model given each sample

sampleselfnsamples1

Generate random samples from the fitted Gaussian distribution

Parameters

nsamples int optional Number of samples to generate Defaults to 1

Returns

Xarray shape nsamples nfeatures Randomly generated sample

yarray shape nsamples Component labels

scoreselfXyNone

Compute the persample average loglikelihood of the given data X

Parameters

Xarraylike shape nsamples ndimensions List of nfeaturesdimensional data points

Each row corresponds to a single data point

Returns

loglikelihood float Log likelihood of the Gaussian mixture given X

scoresamples selfX

Compute the weighted log probabilities for each sample

Parameters

Xarraylike shape nsamples nfeatures List of nfeaturesdimensional data points

Each row corresponds to a single data point

Returns

logprob array shape nsamples Log probabilities of each data point in X

setparams selfparams

Set the parameters of this estimator

The method works on simple estimators as well as on nested objects such as pipelines The latter have parameters of the form componentparameter so that it's possible to update each component of a nested object

Returns

self

Gaussian Mixture

Representation of a Gaussian mixture model probability distribution This class allows to estimate the parameters of a Gaussian mixture distribution

Read more in the User Guide

New in version 018

Parameters

ncomponents int defaults to 1 The number of mixture components

covariancetype 'full' default 'tied' 'diag' 'spherical' String describing the type of

covariance parameters to use Must be one of

'full' each component has its own general covariance matrix

'tied' all components share the same general covariance matrix

'diag' each component has its own diagonal covariance matrix

'spherical' each component has its own single variance

tolfloat defaults to 1e3 The convergence threshold EM iterations will stop when the lower bound average gain is below this threshold

regcovar float defaults to 1e6 Nonnegative regularization added to the diagonal of co

variance Allows to assure that the covariance matrices are all positive

maxiter int defaults to 100 The number of EM iterations to perform

ninit int defaults to 1 The number of initializations to perform The best results are kept

initparams 'kmeans' 'random' defaults to 'kmeans' The method used to initialize the

weights the means and the precisions Must be one of

kmeans responsibilities are initialized using kmeans

random responsibilities are initialized randomly

weightsinit arraylike shape ncomponents optional The userprovided initial weights

defaults to None If it None weights are initialized using the initparams method

meansinit arraylike shape ncomponents nfeatures optional The userprovided initial

means defaults to None If it None means are initialized using the initparams method

precisionsinit arraylike optional The userprovided initial precisions inverse of the co

variance matrices defaults to None If it None precisions are initialized using the

'initparams' method The shape depends on 'covariancetype'

ncomponents ifspherical

nfeatures nfeatures iftied

ncomponents nfeatures ifdiag

sklearnmodelselection GroupKFold

classsklearnmodelselection GroupKFold nsplits'warn'

Kfold iterator variant with nonoverlapping groups

The same group will not appear in two different folds the number of distinct groups has to be at least equal to the number of folds

The folds are approximately balanced in the sense that the number of distinct groups is approximately the same in each fold

Parameters

nsplits int default3 Number of folds Must be at least 2

Changed in version 020 nsplits default value will change from 3 to 5 in v022

Examples using sklearnmodelselectionGroupKFold

•Visualizing crossvalidation behavior in scikitlearn

sklearnmodelselection GroupShuffleSplit

classsklearnmodelselection GroupShuffleSplit nsplits5 testsizeNone

trainsizeNone randomstateNone

ShuffleGroupsOut crossvalidation iterator

Provides randomized traintest indices to split data according to a thirdparty provided group This group information can be used to encode arbitrary domain specific stratifications of the samples as integers

For instance the groups could be the year of collection of the samples and thus allow for crossvalidation against timebased splits

The difference between LeavePGroupsOut and GroupShuffleSplit is that the former generates splits using all subsets of size punique groups whereas GroupShuffleSplit generates a userdetermined number of random test splits each with a userdetermined fraction of unique groups

For example a less computationally intensive alternative to LeavePGroupsOutp10 would be

GroupShuffleSplittestsize10 nsplits100

Note The parameters testsize andtrainsize refer to groups and not to samples as in ShuffleSplit

Parameters

nsplits int default 5 Number of reshuffling splitting iterations

testsize float int None optional defaultNone If float should be between 00 and 10

and represent the proportion of the dataset to include in the test split If int represents the absolute number of test groups If None the value is set to the complement of the train size

Iftrainsize is also None it will be set to 02

trainsize float int or None default is None If float should be between 00 and 10 and

represent the proportion of the groups to include in the train split If int represents the absolute number of train groups If None the value is automatically set to the complement of the test size

randomstate int RandomState instance or None optional defaultNone If int ran

domstate is the seed used by the random number generator If RandomState instance

randomstate is the random number generator If None the random number generator is

the RandomState instance used by nprandom

Methods

getnsplits self X y groups Returns the number of splitting iterations in the cross

validator

split self X y groups Generate indices to split data into training and test set

init selfnsplits5 testsizeNone trainsizeNone randomstateNone

Generate indices to split data into training and test set

Parameters

Xarraylike shape nsamples nfeatures Training data where nsamples is the number

of samples and nfeatures is the number of features

yarraylike of length nsamples optional The target variable for supervised learning

problems

2074 Chapter 6 API (Application Programming Interface) Reference

scikitlearn user guide Release 0213

groups arraylike with shape nsamples Group labels for the samples used while splitting the dataset into traintest set

Yields

train ndarray The training set indices for that split

test ndarray The testing set indices for that split

sklearnmodelselection LeavePGroupsOut

classsklearnmodelselection LeavePGroupsOut ngroups

Leave P Groups Out crossvalidator

Provides traintest indices to split data according to a thirdparty provided group This group information can be used to encode arbitrary domain specific stratifications of the samples as integers

For instance the groups could be the year of collection of the samples and thus allow for crossvalidation against timebased splits

The difference between LeavePGroupsOut and LeaveOneGroupOut is that the former builds the test sets with all the samples assigned to pdifferent values of the groups while the latter uses samples all assigned the same groups

Read more in the User Guide

Parameters

ngroups int Number of groups p to leave out in the test split

See also

GroupKFold Kfold iterator variant with nonoverlapping groups

Examples

```
import numpy as np
from sklearnmodelselection import LeavePGroupsOut
```

```
X nparray1 2 3 4 5 6
```

```
y nparray1 2 1
```

Methods

getnsplits self X y groups Returns the number of splitting iterations in the cross validator

split self X y groups Generate indices to split data into training and test set

init selfngroups

getnsplits selfXNone yNone groupsNone

Returns the number of splitting iterations in the crossvalidator

Parameters

Xobject Always ignored exists for compatibility

yobject Always ignored exists for compatibility

groups arraylike with shape nsamples Group labels for the samples used while splitting the dataset into traintest set This 'groups' parameter must always be specified to calculate the number of splits though the other parameters can be omitted

Returns

nsplits int Returns the number of splitting iterations in the crossvalidator

splitselfXyNone groupsNone

Generate indices to split data into training and test set

Parameters

Xarraylike shape nsamples nfeatures Training data where nsamples is the number of samples and nfeatures is the number of features

yarraylike of length nsamples optional The target variable for supervised learning problems

groups arraylike with shape nsamples Group labels for the samples used while splitting the dataset into traintest set

Yields

train ndarray The training set indices for that split

test ndarray The testing set indices for that split

sklearnmodelselection LeaveOneOut

classsklearnmodelselection LeaveOneOut

LeaveOneOut crossvalidator

Provides traintest indices to split data in traintest sets Each sample is used once as a test set singleton while the remaining samples form the training set

NoteLeaveOneOut is equivalent to KFoldnsplitsn andLeavePOutp1 wherenis the number of samples

2076 Chapter 6 API (Application Programming Interface) Reference

scikitlearn user guide Release 0213

Due to the high number of test sets which is the same as the number of samples this crossvalidation method can be very costly For large datasets one should favor KFold ShuffleSplit orStratifiedKFold

Read more in the User Guide

See also

LeaveOneGroupOut For splitting the data according to explicit domainspecific stratification of the dataset

GroupKFold Kfold iterator variant with nonoverlapping groups

Examples

```

splitselfXyNone groupsNone

Generate indices to split data into training and test set

Parameters

Xarraylike shape nsamples nfeatures Training data where nsamples is the number of samples and nfeatures is the number of features

yarraylike of length nsamples The target variable for supervised learning problems

groups arraylike with shape nsamples optional Group labels for the samples used

while splitting the dataset into traintest set

Yields

train ndarray The training set indices for that split

test ndarray The testing set indices for that split

sklearnmodelselection LeavePOut

classsklearnmodelselection LeavePOut p

LeavePOut crossvalidator

Provides traintest indices to split data in traintest sets This results in testing on all distinct samples of size p while the remaining n - p samples form the training set in each iteration

NoteLeavePOutp is NOT equivalent to KFoldnsplitsnsamples - p which creates non overlapping test sets

Due to the high number of iterations which grows combinatorically with the number of samples this cross validation method can be very costly For large datasets one should favor KFold StratifiedKFold or

ShuffleSplit

Read more in the User Guide

Parameters

pint Size of the test sets Must be strictly greater than the number of samples

Examples

```
import numpy as np
from sklearnmodelselection import LeavePOut
```

```
X nparray1 2 3 4 5 6 7 8
```

scikitlearn user guide Release 0213

Notes

Randomized CV (Cross-Validation) splitters may return different results for each call of split You can make the results identical by setting randomstate to an integer

Examples using sklearnmodelselectionShuffleSplit

- Visualizing crossvalidation behavior in scikitlearn

- Plotting Learning Curves

- Scaling the regularization parameter for SVCs

sklearnmodelselection StratifiedKFold

class sklearnmodelselection StratifiedKFold nsplits'warn' shuffleFalse randomstateNone

Stratified KFold crossvalidator

Provides train test indices to split data in train test sets

This crossvalidation object is a variation of KFold that returns stratified folds The folds are made by preserving the percentage of samples for each class

Read more in the User Guide

Parameters

nsplits int default3 Number of folds Must be at least 2

Changed in version 020 nsplits default value will change from 3 to 5 in v022

shuffle boolean optional Whether to shuffle each class's samples before splitting into batches

randomstate int RandomState instance or None optional defaultNone If int random

domstate is the seed used by the random number generator If RandomState instance

randomstate is the random number generator If None the random number generator is

the RandomState instance used by nprandom Used when shuffle True

See also

RepeatedStratifiedKFold Repeats Stratified KFold n times

Notes

Train and test sizes may be different in each fold with a difference of at most nclasses

Examples

```
import numpy as np
```

```
from sklearnmodelselection import StratifiedKFold
```

```
X nparray1 2 3 4 1 2 3 4

- Visualizing crossvalidation behavior in scikitlearn
- RBF (Radial Basis Function) SVM (Support Vector Machine) parameters

sklearnmodelselection TimeSeriesSplit

classsklearnmodelselection TimeSeriesSplit nsplits'warn' maxtrainsizeNone

Time Series crossvalidator

Provides traintest indices to split time series data samples that are observed at fixed time intervals in traintest sets In each split test indices must be higher than before and thus shuffling in cross validator is inappropriate

This crossvalidation object is a variation of KFold In the kth split it returns first k folds as train set and the k1th fold as test set

Note that unlike standard crossvalidation methods successive training sets are supersets of those that come before them

Read more in the User Guide

Parameters

nsplits int default3 Number of splits Must be at least 2

Changed in version 020 nsplits default value will change from 3 to 5 in v022

maxtrainsize int optional Maximum size for a single training set

Notes

•Visualizing crossvalidation behavior in scikitlearn

6262 Splitter Functions

modelselectioncheckcv cv y classifier Input checker utility for building a crossvalidator

modelselectiontraintestsplit arrays

Split arrays or matrices into random train and test subsets

sklearnmodelselection checkcv

sklearnmodelselection checkcv cv'warn' yNone classifierFalse

Input checker utility for building a crossvalidator

Parameters

626sklearnmodelselection Model Selection 2091

scikitlearn user guide Release 0213

cvint crossvalidation generator or an iterable optional Determines the crossvalidation splitting strategy Possible inputs for cv are

- None to use the default 3fold crossvalidation
 - integer to specify the number of folds
 - CV (Cross-Validation) splitter
 - An iterable yielding train test splits as arrays of indices
- For integerNone inputs if classifier is True and yis either binary or multiclass StratifiedKFold is used In all other cases KFold is used

Refer User Guide for the various crossvalidation strategies that can be used here

Changed in version 020 cvdefault value will change from 3fold to 5fold in v022

yarraylike optional The target variable for supervised learning problems

classifier boolean optional default False Whether the task is a classification task in which case stratified KFold will be used

Returns

checkedcv a crossvalidator instance The return value is a crossvalidator which generates the traintest splits via the split method

sklearnmodelselection traintestsplit

sklearnmodelselection traintestsplit arrays options

Split arrays or matrices into random train and test subsets

Quick utility that wraps input validation and nextShuffleSplitsplitX y and application to

input data into a single call for splitting and optionally subsampling data in a oneliner

Read more in the User Guide

Parameters

arrays sequence of indexables with same length shape0 Allowed inputs are lists numpy

arrays scipysparse matrices or pandas dataframes

testsize float int or None optional defaultNone If float should be between 00 and 10

and represent the proportion of the dataset to include in the test split If int represents the absolute number of test samples If None the value is set to the complement of the train

size Iftrainsize is also None it will be set to 025

trainsize float int or None defaultNone If float should be between 00 and 10 and

represent the proportion of the dataset to include in the train split If int represents the absolute number of train samples If None the value is automatically set to the complement of the test size

randomstate int RandomState instance or None optional defaultNone If int ran

domstate is the seed used by the random number generator If RandomState instance

randomstate is the random number generator If None the random number generator is

the RandomState instance used by nprandom

shuffle boolean optional defaultTrue Whether or not to shuffle the data before splitting If

shuffleFalse then stratify must be None

stratify arraylike or None defaultNone If not None data is split in a stratified fashion

using this as the class labels

2092 Chapter 6 API (Application Programming Interface) Reference

scikitlearn user guide Release 0213

Returns

splitting list length2 lenarrays List containing traintest split of inputs

New in version 016 If the input is sparse the output will be a scipysparse

csrmatrix Else output type is the same as the input type

Examples using sklearnmodelselectiontraintestsplit

- Faces recognition example using eigenfaces and SVMs

- Prediction Latency

- Probability Calibration curves

- Probability calibration of classifiers

- Classifier comparison

- Column Transformer with Mixed Types

- Effect of transforming the targets in regression model

- Comparing random forests and the multioutput meta estimator

- Early stopping of Gradient Boosting

626sklearnmodelselection Model Selection 2093

scikitlearn user guide Release 0213

- Feature transformations with ensembles of trees
- Gradient Boosting OutofBag estimates
- Pipeline Anova SVM (Support Vector Machine)
- Comparing various online solvers
- MNIST classffication using multinomial logistic L1
- Multiclass sparse logisitic regression on newgroups20
- Early stopping of Stochastic Gradient Descent
- Parameter estimation using grid search with crossvalidation
- Confusion matrix
- Receiver Operating Characteristic ROC
- PrecisionRecall
- Classifier Chain
- Comparing Nearest Neighbors with and without Neighborhood Components Analysis
- Dimensionality Reduction with Neighborhood Components Analysis
- Restricted Boltzmann Machine features for digit classification
- Varying regularization in Multilayer Perceptron
- Using FunctionTransformer to select columns
- Importance of Feature Scaling
- Map data to a normal distribution
- Feature discretization
- Understanding the decision tree structure

Exhaustive search over specified parameter values for an estimator

Important members are fit predict

2094 Chapter 6 API (Application Programming Interface) Reference

scikitlearn user guide Release 0213

GridSearchCV implements a “fit” and a “score” method. It also implements “predict”, “predict_proba”, “decision_function”, “transform” and “inverse_transform” if they are implemented in the estimator used. The parameters of the estimator used to apply these methods are optimized by cross-validated gridsearch over a parameter grid.

Read more in the User Guide

Parameters

estimator: estimator object. This is assumed to implement the scikitlearn estimator interface.

Either estimator needs to provide a score function or scoring must be passed.

param_grid: dict or list of dictionaries. Dictionary with parameters names (string) as keys and lists of parameter settings to try as values or a list of such dictionaries in which case the grids spanned by each dictionary in the list are explored. This enables searching over any sequence of parameter settings.

scoring: string, callable, list/tuple, dict or None. default: None. A single string see The scoring parameter defining model evaluation rules or a callable see Defining your scoring strategy from metric functions to evaluate the predictions on the test set.

For evaluating multiple metrics, either give a list of unique strings or a dict with names as keys and callables as values.

NOTE that when using custom scorers, each scorer should return a single value. Metric functions returning a list/array of values can be wrapped into multiple scorers that return one value each.

See Specifying multiple metrics for evaluation for an example.

If None, the estimator’s score method is used.

n_jobs: int or None. optional. default: None. Number of jobs to run in parallel. None means 1 unless in a joblibparallelbackend context. 1 means using all processors. See Glossary for more details.

pre_dispatch: int or string. optional. Controls the number of jobs that get dispatched during parallel execution. Reducing this number can be useful to avoid an explosion of memory consumption when more jobs get dispatched than CPUs can process. This parameter can be

- None, in which case all the jobs are immediately created and spawned. Use this for lightweight and fast-running jobs to avoid delays due to on-demand spawning of the jobs.
- An int giving the exact number of total jobs that are spawned.
- A string giving an expression as a function of n_jobs as in ‘2*n_jobs’.

iid: boolean. default: ‘warn’. If True, return the average score across folds weighted by the number of samples in each test set. In this case, the data is assumed to be identically distributed across the folds and the loss minimized is the total loss per sample, and not the mean loss across the folds. If False, return the average score across folds. Default is True, but will change to False in version 0.22 to correspond to the standard definition of cross-validation.

Changed in version 0.20: Parameter iid will change from True to False by default in version 0.22 and will be removed in 0.24.

cv: int, cross-validation generator or an iterable. optional. Determines the cross-validation splitting strategy. Possible inputs for cv are:

- None, to use the default 3-fold cross-validation.

626sklearnmodelselection Model Selection 2095

scikitlearn user guide Release 0213

- integer to specify the number of folds in a StratifiedKFold
- CV (Cross-Validation) splitter
- An iterable yielding train test splits as arrays of indices

For integerNone inputs if the estimator is a classifier and yis either binary or multiclass StratifiedKFold is used In all other cases KFold is used

Refer User Guide for the various crossvalidation strategies that can be used here
Changed in version 020 cvdefault value if None will change from 3fold to 5fold in v022

refit boolean string or callable defaultTrue Refit an estimator using the best found parameters on the whole dataset

For multiple metric evaluation this needs to be a string denoting the scorer that would be used to find the best parameters for refitting the estimator at the end

Where there are considerations other than maximum score in choosing a best estimator torrefit can be set to a function which returns the selected bestindex given

cvresults

The refitted estimator is made available at the bestestimator attribute and permits usingpredict directly on this GridSearchCV instance

Also for multiple metric evaluation the attributes bestindex bestscore and bestparams will only be available if refit is set and all of them will be determined wrt this specific scorer bestscore is not returned if refit is callable

Seescoring parameter to know more about multiple metric evaluation

Changed in version 020 Support for callable added

verbose integer Controls the verbosity the higher the more messages

errorscore 'raise' or numeric Value to assign to the score if an error occurs in estimator fitting If set to 'raise' the error is raised If a numeric value is given FitFailedWarning

is raised This parameter does not affect the refit step which will always raise the error

Default is 'raise' but from version 022 it will change to npnan

returntrainscore boolean defaultFalse If False thecvresults attribute will not

include training scores Computing training scores is used to get insights on how different parameter settings impact the overfittingunderfitting tradeoff However computing the scores on the training set can be computationally expensive and is not strictly required to select the parameters that yield the best generalization performance

Attributes

cvresults dict of numpy masked ndarrays A dict with keys as column headers and values as columns that can be imported into a pandas DataFrame

For instance the below given table

| paramkernel | paramgamma | paramdegree | split0testscore | rankt |
|-------------|------------|-------------|-----------------|-------|
| 'poly' | - 2 | 080 | 2 | |
| 'poly' | - 3 | 070 | 4 | |
| 'rbf' | 01 | - 080 | 3 | |
| 'rbf' | 02 | - 093 | 1 | |

will be represented by a cvresults dict of

2096 Chapter 6 API (Application Programming Interface) Reference

scikitlearn user guide Release 0213

paramkernel maskedarraydata poly poly rbf rbf
mask False False False False
paramgamma maskedarraydata 01 02
mask True True False False
paramdegree maskedarraydata 20 30
mask False False True True
split0testscore 080 070 080 093
split1testscore 082 050 070 078
meantestscore 081 060 075 085
stdtestscore 001 010 005 008
ranktestscore 2 4 3 1
split0trainscore 080 092 070 093
split1trainscore 082 055 070 087
meantrainscore 081 074 070 090
stdtrainscore 001 019 000 003
meanfittime 073 063 043 049
stdfittime 001 002 001 001
meanscoretime 001 006 004 004
stdscoretime 000 000 000 001
params kernel poly degree 2

NOTE
The keyparams is used to store a list of parameter settings dicts for all the parameter candidates

Themeanfittime stdfittime meanscoretime and stdscoretime are all in seconds
For multimetric evaluation the scores for all the scorers are available in the cvresults dict at the keys ending with that scorer's name scorername instead ofscore shown above 'split0testprecision' 'meantrainprecision' etc
bestestimator estimator or dict Estimator that was chosen by the search ie estimator which gave highest score or smallest loss if specified on the left out data Not available if refitFalse

Seerefit parameter for more information on allowed values
bestscore float Mean crossvalidated score of the bestestimator
For multimetric evaluation this is present only if refit is specified
bestparams dict Parameter setting that gave the best results on the hold out data
For multimetric evaluation this is present only if refit is specified
bestindex int The index of the cvresults arrays which corresponds to the best candidate parameter setting
The dict at searchcvresultsparmssearchbestindex gives the parameter setting for the best model that gives the highest mean score search bestscore
For multimetric evaluation this is present only if refit is specified
scorer function or a dict Scorer function used on the held out data to choose the best parameters for the model
626sklearnmodelselection Model Selection 2097

scikitlearn user guide Release 0213

For multimetric evaluation this attribute holds the validated scoring dict which maps

the scorer key to the scorer callable

nsplits int The number of crossvalidation splits foldsiterations

refittime float Seconds used for refitting the best model on the whole dataset

This is present only if refit is not False

See also

ParameterGrid generates all the combinations of a hyperparameter grid

sklearnmodelselectiontrainstestsplit utility function to split the data into a development

set usable for fitting a GridSearchCV instance and an evaluation set for its final evaluation

sklearnmetricsmakescorer Make a scorer from a performance metric or loss function

Notes

The parameters selected are those that maximize the score of the left out data unless an explicit score is passed

in which case it is used instead

Ifnjobs was set to a value higher than one the data is copied for each point in the grid and not njobs times

This is done for efficiency reasons if individual jobs take very little time but may raise errors if the dataset

is large and not enough memory is available A workaround in this case is to set predispatch Then

the memory is copied only predispatch many times A reasonable value for predispatch is2

njobs

Methods

decisionfunction self X Call decisionfunction on the estimator with the best found parameters

fitself X y groups Run fit with all sets of parameters

getparams self deep Get parameters for this estimator

inversetransform self Xt Call inversetransform on the estimator with the best found params

predict self X Call predict on the estimator with the best found parameters

predictlogproba self X Call predictlogproba on the estimator with the best found parameters

predictproba self X Call predictproba on the estimator with the best found parameters

score self X y Returns the score on the given data if the estimator has been refit

setparams self params Set the parameters of this estimator

transform self X Call transform on the estimator with the best found parameters

init selfestimator paramgrid scoringNone njobsNone iid'warn' refitTrue cv'warn' verbose0 predispatch'2njobs' errorscore'raisedeprecating' re

turntrainscoreFalse

decisionfunction selfX

Call decisionfunction on the estimator with the best found parameters

Only available if refitTrue and the underlying estimator supports decisionfunction

Parameters

Xindexable length nsamples Must fulfill the input assumptions of the underlying estimator

fitselfXyNone groupsNone fitparams

Run fit with all sets of parameters

Parameters

Xarraylike shape nsamples nfeatures Training vector where nsamples is the number of samples and nfeatures is the number of features

yarraylike shape nsamples or nsamples noutput optional Target relative to X for classification or regression None for unsupervised learning

groups arraylike with shape nsamples optional Group labels for the samples used while splitting the dataset into traintest set Only used in conjunction with a "Group" cv

instance eg GroupKFold

fitparams dict of string object Parameters passed to the fit method of the estimator

getparams selfdeepTrue

Get parameters for this estimator

Parameters

deep boolean optional If True will return the parameters for this estimator and contained subobjects that are estimators

626sklearnmodelselection Model Selection 2099

scikitlearn user guide Release 0213

Returns
params mapping of string to any Parameter names mapped to their values
inversetransform selfXt
Call inversetransform on the estimator with the best found params
Only available if the underlying estimator implements inversetransform andrefitTrue
Parameters
Xtindexable length nsamples Must fulfill the input assumptions of the underlying estimator
predictselfX
Call predict on the estimator with the best found parameters
Only available if refitTrue and the underlying estimator supports predict
Parameters
Xindexable length nsamples Must fulfill the input assumptions of the underlying estimator
predictlogproba selfX
Call predictlogproba on the estimator with the best found parameters
Only available if refitTrue and the underlying estimator supports predictlogproba
Parameters
Xindexable length nsamples Must fulfill the input assumptions of the underlying estimator
predictproba selfX
Call predictproba on the estimator with the best found parameters
Only available if refitTrue and the underlying estimator supports predictproba
Parameters
Xindexable length nsamples Must fulfill the input assumptions of the underlying estimator
scoreselfXyNone
Returns the score on the given data if the estimator has been refit
This uses the score defined by scoring where provided and the bestestimatorscore method otherwise
Parameters
Xarraylike shape nsamples nfeatures Input data where nsamples is the number of samples and nfeatures is the number of features
yarraylike shape nsamples or nsamples noutput optional Target relative to X for classification or regression None for unsupervised learning
Returns
score float
setparams selfparams
Set the parameters of this estimator
2100 Chapter 6 API (Application Programming Interface) Reference

scikitlearn user guide Release 0213

The method works on simple estimators as well as on nested objects such as pipelines The latter have parameters of the form componentparameter so that it's possible to update each component of a nested object

Returns

self

transform selfX

Call transform on the estimator with the best found parameters

Only available if the underlying estimator supports transform andrefitTrue

Parameters

Xindexable length nsamples Must fulfill the input assumptions of the underlying estimator

Examples using sklearnmodelselectionGridSearchCV

- Comparison of kernel ridge regression and SVR (Support Vector Regression)
- Faces recognition example using eigenfaces and SVMs
- Feature agglomeration vs univariate selection
- Concatenating multiple feature extraction methods
- Pipelining chaining a PCA (Principal Component Analysis) and a logistic regression
- Column Transformer with Mixed Types
- Selecting dimensionality reduction with Pipeline and GridSearchCV
- Shrinkage covariance estimation LedoitWolf vs OAS and maxlikelihood
- Model selection with Probabilistic PCA (Principal Component Analysis) and Factor Analysis FA
- Crossvalidation on diabetes Dataset Exercise
- Comparison of kernel ridge and Gaussian process regression
- Parameter estimation using grid search with crossvalidation
- Comparing randomized search and grid search for hyperparameter estimation
- Nested versus nonnested crossvalidation
- Demonstration of multimetric evaluation on crossvalscore and GridSearchCV
- Balance model complexity and crossvalidated score
- Sample pipeline for text feature extraction and evaluation
- Kernel Density Estimation
- Feature discretization
- Scaling the regularization parameter for SVCs
- RBF (Radial Basis Function) SVM (Support Vector Machine) parameters

scikitlearn user guide Release 0213

sklearnmodelselection ParameterGrid

classsklearnmodelselection ParameterGrid paramgrid

Grid of parameters with a discrete number of values for each

Can be used to iterate over parameter value combinations with the Python builtin function iter

Read more in the User Guide

Parameters

paramgrid dict of string to sequence or sequence of such The parameter grid to explore as a dictionary mapping estimator parameters to sequences of allowed values

An empty dict signifies default parameters

A sequence of dicts signifies a sequence of grids to search and is useful to avoid exploring parameter combinations that make no sense or have no effect See the examples below

See also

GridSearchCV UsesParameterGrid to perform a full parallelized parameter search

Examples

```
from sklearnmodelselection import ParameterGrid
```

```
paramgrid = {'a': [1, 2], 'b': [True, False]}
```

```
list(ParameterGrid(paramgrid))
```

```
[{'a': 1, 'b': True}, {'a': 1, 'b': False},
```

```
 {'a': 2, 'b': True}, {'a': 2, 'b': False}]
```

```
True
```

```
grid = {'kernel': ['linear', 'rbf'], 'gamma': [1, 10]}
```

```
list(ParameterGrid(grid))
```

```
[{'kernel': 'rbf', 'gamma': 1},
```

```
 {'kernel': 'rbf', 'gamma': 10},
```

```
 {'kernel': 'linear', 'gamma': 1},
```

```
 {'kernel': 'linear', 'gamma': 10}]
```

```
True
```

```
init selfparamgrid
```

sklearnmodelselection ParameterSampler

classsklearnmodelselection ParameterSampler paramdistributions niter randomstate

domstateNone

Generator on parameters sampled from given distributions

Nondeterministic iterable over random candidate combinations for hyper parameter search If all parameters are presented as a list sampling without replacement is performed If at least one parameter is given as a distribution sampling with replacement is used It is highly recommended to use continuous distributions for continuous parameters

Note that before SciPy 0.16 the scipystatsdistributions do not accept a custom RNG instance

and always use the singleton RNG from numpy.random Hence setting randomstate will not guarantee

a deterministic iteration whenever scipystats distributions are used to define the parameter search space

Deterministic behavior is however guaranteed from SciPy 0.16 onwards

2102 Chapter 6 API (Application Programming Interface) Reference

scikitlearn user guide Release 0213

Read more in the User Guide

Parameters

paramdistributions dict Dictionary where the keys are parameters and values are distributions from which a parameter is to be sampled Distributions either have to provide a rvs function to sample from them or can be given as a list of values where a uniform distribution is assumed

niter integer Number of parameter settings that are produced

randomstate int RandomState instance or None optional defaultNone Pseudo random

number generator state used for random uniform sampling from lists of possible values

instead of scipystats distributions If int randomstate is the seed used by the random

number generator If RandomState instance randomstate is the random number generator

If None the random number generator is the RandomState instance used by nprandom

Returns

params dict of string to any Yields dictionaries mapping each estimator parameter to as sam

pled value

Examples

```
from sklearnmodelselection import ParameterSampler

```

Randomized search on hyper parameters

RandomizedSearchCV implements a “fit” and a “score” method It also implements “predict” “predictproba”

“decisionfunction” “transform” and “inversetransform” if they are implemented in the estimator used

626sklearnmodelselection Model Selection 2103

scikitlearn user guide Release 0213

The parameters of the estimator used to apply these methods are optimized by crossvalidated search over parameter settings

In contrast to GridSearchCV not all parameter values are tried out but rather a fixed number of parameter settings is sampled from the specified distributions The number of parameter settings that are tried is given by niter

If all parameters are presented as a list sampling without replacement is performed If at least one parameter is given as a distribution sampling with replacement is used It is highly recommended to use continuous distributions for continuous parameters

Note that before SciPy 016 the scipystatsdistributions do not accept a custom RNG instance and always use the singleton RNG from numpyrandom Hence setting randomstate will not guarantee a deterministic iteration whenever scipystats distributions are used to define the parameter search space Read more in the User Guide

Parameters

estimator estimator object A object of that type is instantiated for each grid point This is assumed to implement the scikitlearn estimator interface Either estimator needs to provide ascore function or scoring must be passed

paramdistributions dict Dictionary with parameters names string as keys and distributions or lists of parameters to try Distributions must provide a rvs method for sampling such as those from scipystatsdistributions If a list is given it is sampled uniformly

niter int default10 Number of parameter settings that are sampled niter trades off runtime vs quality of the solution

scoring string callable listtuple dict or None default None A single string see The scoring parameter defining model evaluation rules or a callable see Defining your scoring strategy from metric functions to evaluate the predictions on the test set

For evaluating multiple metrics either give a list of unique strings or a dict with names as keys and callables as values

NOTE that when using custom scorers each scorer should return a single value Metric functions returning a listarray of values can be wrapped into multiple scorers that return one value each

SeeSpecifying multiple metrics for evaluation for an example

If None the estimator’s score method is used

njobs int or None optional defaultNone Number of jobs to run in parallel None means 1 unless in a joblibparallelbackend context1means using all processors See

Glossary for more details

predispach int or string optional Controls the number of jobs that get dispatched during parallel execution Reducing this number can be useful to avoid an explosion of memory consumption when more jobs get dispatched than CPUs can process This parameter can be

- None in which case all the jobs are immediately created and spawned Use this for lightweight and fastrunning jobs to avoid delays due to ondemand spawning of the jobs
- An int giving the exact number of total jobs that are spawned
- A string giving an expression as a function of njobs as in ‘2njobs’

scikitlearn user guide Release 0213

iidboolean default'warn' If True return the average score across folds weighted by the number of samples in each test set In this case the data is assumed to be identically distributed across the folds and the loss minimized is the total loss per sample and not the mean loss across the folds If False return the average score across folds Default is True but will change to False in version 022 to correspond to the standard definition of cross validation

Changed in version 020 Parameter iid will change from True to False by default in version 022 and will be removed in 024

cvint crossvalidation generator or an iterable optional Determines the crossvalidation splitting strategy Possible inputs for cv are

- None to use the default 3fold cross validation
- integer to specify the number of folds in a StratifiedKFold
- CV (Cross-Validation) splitter
- An iterable yielding train test splits as arrays of indices

For integerNone inputs if the estimator is a classifier and yis either binary or multiclass StratifiedKFold is used In all other cases KFold is used

Refer User Guide for the various crossvalidation strategies that can be used here

Changed in version 020 cvdefault value if None will change from 3fold to 5fold in v022

refit boolean string or callable defaultTrue Refit an estimator using the best found parameters on the whole dataset

For multiple metric evaluation this needs to be a string denoting the scorer that would be used to find the best parameters for refitting the estimator at the end

Where there are considerations other than maximum score in choosing a best estimator refit can be set to a function which returns the selected bestindex given the cvresults

The refitted estimator is made available at the bestestimator attribute and permits usingpredict directly on this RandomizedSearchCV instance

Also for multiple metric evaluation the attributes bestindex bestscore and bestparams will only be available if refit is set and all of them will be determined wrt this specific scorer When refit is callable bestscore is disabled

Seescoring parameter to know more about multiple metric evaluation

Changed in version 020 Support for callable added

verbose integer Controls the verbosity the higher the more messages

randomstate int RandomState instance or None optional defaultNone Pseudo random number generator state used for random uniform sampling from lists of possible values instead of scipystats distributions If int randomstate is the seed used by the random number generator If RandomState instance randomstate is the random number generator If None the random number generator is the RandomState instance used by nprandom errorscore 'raise' or numeric Value to assign to the score if an error occurs in estimator fitting If set to 'raise' the error is raised If a numeric value is given FitFailedWarning is raised This parameter does not affect the refit step which will always raise the error Default is 'raise' but from version 022 it will change to npnan

626sklearnmodelselection Model Selection 2105

scikitlearn user guide Release 0213

returntrainscore boolean defaultFalse If False thecvresults attribute will not include training scores Computing training scores is used to get insights on how different parameter settings impact the overfittingunderfitting tradeoff However computing the scores on the training set can be computationally expensive and is not strictly required to select the parameters that yield the best generalization performance

Attributes
cvresults dict of numpy masked ndarrays A dict with keys as column headers and values as columns that can be imported into a pandas DataFrame

For instance the below given table
paramkernel paramgamma split0testscore ranktestscore
'rbf' 01 080 2
'rbf' 02 090 1
'rbf' 03 070 1
will be represented by a cvresults dict of

```

NOTE
The keyparams is used to store a list of parameter settings dicts for all the parameter candidates

Themeanfittime stdfittime meanscoretime and stdscoretime are all in seconds
For multimetric evaluation the scores for all the scorers are available in the cvresults dict at the keys ending with that scorer's name scorername instead ofscore shown above 'split0testprecision' 'meantrainprecision' etc
bestestimator estimator or dict Estimator that was chosen by the search ie estimator which gave highest score or smallest loss if specified on the left out data Not available if refitFalse

For multimetric evaluation this attribute is present only if refit is specified
Seerefit parameter for more information on allowed values
2106 Chapter 6 API (Application Programming Interface) Reference

scikitlearn user guide Release 0213

bestscore float Mean crossvalidated score of the bestestimator

For multimetric evaluation this is not available if refit isFalse Seerefit parameter for more information

bestparams dict Parameter setting that gave the best results on the hold out data

For multimetric evaluation this is not available if refit isFalse Seerefit parameter for more information

bestindex int The index of the cvresults arrays which corresponds to the best candidate parameter setting

The dict at searchcvresultsparmssearchbestindex gives

the parameter setting for the best model that gives the highest mean score search bestscore

For multimetric evaluation this is not available if refit isFalse Seerefit parameter for more information

scorer function or a dict Scorer function used on the held out data to choose the best parameters for the model

For multimetric evaluation this attribute holds the validated scoring dict which maps the scorer key to the scorer callable

nsplits int The number of crossvalidation splits foldsiterations

refittime float Seconds used for refitting the best model on the whole dataset This is present only if refit is not False

See also

GridSearchCV Does exhaustive search over a grid of parameters

ParameterSampler A generator over parameter settings constructed from paramdistributions Notes

The parameters selected are those that maximize the score of the heldout data according to the scoring parameter

Ifnjobs was set to a value higher than one the data is copied for each parameter settingand not njobs times This is done for efficiency reasons if individual jobs take very little time but may raise errors if the dataset

is large and not enough memory is available A workaround in this case is to set predispatch Then the memory is copied only predispatch many times A reasonable value for predispatch is2

njobs

Methods

decisionfunction self X Call decisionfunction on the estimator with the best found parameters

fitself X y groups Run fit with all sets of parameters

getparams self deep Get parameters for this estimator

inversetransform self Xt Call inversetransform on the estimator with the best found params

Continued on next page

626sklearnmodelselection Model Selection 2107

predict self X Call predict on the estimator with the best found parameters

predictlogproba self X Call predictlogproba on the estimator with the best found parameters

predictproba self X Call predictproba on the estimator with the best found parameters

score self X y Returns the score on the given data if the estimator has been refit

setparams self params Set the parameters of this estimator

transform self X Call transform on the estimator with the best found parameters

init selfestimator paramdistributions niter10 scoringNone njobsNone iid'warn'

refitTrue cv'warn' verbose0 predispatch'2njobs' randomstateNone

errorscore'raisedeprecating' returntrainscoreFalse

decisionfunction selfX

Call decisionfunction on the estimator with the best found parameters

Only available if refitTrue and the underlying estimator supports decisionfunction

Parameters

Xindexable length nsamples Must fulfill the input assumptions of the underlying estimator

fitselfXyNone groupsNone fitparams

Run fit with all sets of parameters

Parameters

Xarraylike shape nsamples nfeatures Training vector where nsamples is the number of samples and nfeatures is the number of features

yarraylike shape nsamples or nsamples noutput optional Target relative to X for classification or regression None for unsupervised learning

groups arraylike with shape nsamples optional Group labels for the samples used while splitting the dataset into traintest set Only used in conjunction with a "Group" cv instance eg GroupKFold

fitparams dict of string object Parameters passed to the fit method of the estimator

getparams selfdeepTrue

Get parameters for this estimator

Parameters

deep boolean optional If True will return the parameters for this estimator and contained subobjects that are estimators

Returns

params mapping of string to any Parameter names mapped to their values

inversetransform selfXt

Call inversetransform on the estimator with the best found params

Only available if the underlying estimator implements inversetransform andrefitTrue

Parameters

2108 Chapter 6 API (Application Programming Interface) Reference

Xtindexable length nsamples Must fulfill the input assumptions of the underlying estimator

predictselfX

Call predict on the estimator with the best found parameters

Only available if refitTrue and the underlying estimator supports predict

Parameters

Xtindexable length nsamples Must fulfill the input assumptions of the underlying estimator

predictlogproba selfX

Call predictlogproba on the estimator with the best found parameters

Only available if refitTrue and the underlying estimator supports predictlogproba

Parameters

Xtindexable length nsamples Must fulfill the input assumptions of the underlying estimator

predictproba selfX

Call predictproba on the estimator with the best found parameters

Only available if refitTrue and the underlying estimator supports predictproba

Parameters

Xtindexable length nsamples Must fulfill the input assumptions of the underlying estimator

scoreselfXyNone

Returns the score on the given data if the estimator has been refit

This uses the score defined by scoring where provided and the bestestimatorscore method

otherwise

Parameters

Xarraylike shape nsamples nfeatures Input data where nsamples is the number of samples and nfeatures is the number of features

yarraylike shape nsamples or nsamples noutput optional Target relative to X

for classification or regression None for unsupervised learning

Returns

score float

setparams selfparams

Set the parameters of this estimator

The method works on simple estimators as well as on nested objects such as pipelines The latter have parameters of the form componentparameter so that it's possible to update each component of a nested object

Returns

self

transform selfX

Call transform on the estimator with the best found parameters

Only available if the underlying estimator supports transform andrefitTrue

scikitlearn user guide Release 0213

Parameters

Xindexable length nsamples Must fulfill the input assumptions of the underlying estimator

Examples using sklearnmodelselectionRandomizedSearchCV

•Comparing randomized search and grid search for hyperparameter estimation

modelselectionfitgridpoint X y

Run fit on one set of parameters

sklearnmodelselection fitgridpoint

sklearnmodelselection fitgridpoint Xyestimator parameters train testscorer

verbose errorscore'raisedeprecating'

fitparams

Run fit on one set of parameters

Parameters

Xarraylike sparse matrix or list Input data

yarraylike or None Targets for input data

estimator estimator object A object of that type is instantiated for each grid point This is assumed to implement the scikitlearn estimator interface Either estimator needs to provide a score function or scoring must be passed

parameters dict Parameters to be set on estimator for this grid point

train ndarray dtype int or bool Boolean mask or indices for training set

test ndarray dtype int or bool Boolean mask or indices for test set

scorer callable or None The scorer callable object function must have its signature as

scorerestimator X y

IfNone the estimator's score method is used

verbose int Verbosity level

fitparams kwargs Additional parameter passed to the fit function of the estimator

errorscore 'raise' or numeric Value to assign to the score if an error occurs in estimator

fitting If set to 'raise' the error is raised If a numeric value is given FitFailedWarning

is raised This parameter does not affect the refit step which will always raise the error

Default is 'raise' but from version 022 it will change to npnan

Returns

score float Score of this parameter setting on given test split

parameters dict The parameters that have been evaluated

nsamplestest int Number of test samples in this split

Read more in the User Guide

Parameters

estimator estimator object implementing 'fit' The object to use to fit the data

Xarraylike The data to fit Can be for example a list or an array

yarraylike optional default None The target variable to try to predict in the case of super
vised learning

groups arraylike with shape nsamples optional Group labels for the samples used while
splitting the dataset into traintest set Only used in conjunction with a "Group" cvinstance

egGroupKFold

scoring string callable listtuple dict or None default None A single string see The scoring
parameter defining model evaluation rules or a callable see Defining your scoring strategy
from metric functions to evaluate the predictions on the test set

For evaluating multiple metrics either give a list of unique strings or a dict with names as
keys and callables as values

NOTE that when using custom scorers each scorer should return a single value Metric
functions returning a listarray of values can be wrapped into multiple scorers that return
one value each

SeeSpecifying multiple metrics for evaluation for an example

If None the estimator's score method is used

cvint crossvalidation generator or an iterable optional Determines the crossvalidation split
ting strategy Possible inputs for cv are

- None to use the default 3fold cross validation
- integer to specify the number of folds in a StratifiedKFold
- CV (Cross-Validation) splitter

626sklearnmodelselection Model Selection 2111

scikitlearn user guide Release 0213

- An iterable yielding train test splits as arrays of indices
- For integerNone inputs if the estimator is a classifier and yis either binary or multiclass StratifiedKFold is used In all other cases KFold is used

Refer User Guide for the various crossvalidation strategies that can be used here

Changed in version 020 cvdefault value if None will change from 3fold to 5fold in v022

njobs int or None optional defaultNone The number of CPUs to use to do the computa tionNone means 1 unless in a joblibparallelbackend context1means using

all processors See Glossary for more details

verbose integer optional The verbosity level

fitparams dict optional Parameters to pass to the fit method of the estimator

predispatch int or string optional Controls the number of jobs that get dispatched during

parallel execution Reducing this number can be useful to avoid an explosion of memory

consumption when more jobs get dispatched than CPUs can process This parameter can

be

- None in which case all the jobs are immediately created and spawned Use this for lightweight and fastrunning jobs to avoid delays due to ondemand spawning of the jobs
- An int giving the exact number of total jobs that are spawned
- A string giving an expression as a function of njobs as in ‘2njobs’

returntrainscore boolean defaultFalse Whether to include train scores Computing train

ing scores is used to get insights on how different parameter settings impact the overfit

tingunderfitting tradeoff However computing the scores on the training set can be com

putationally expensive and is not strictly required to select the parameters that yield the best

generalization performance

returnestimator boolean default False Whether to return the estimators fitted on each split

errorscore ‘raise’ ‘raisedeprecating’ or numeric Value to assign to the score if an error

occurs in estimator fitting If set to ‘raise’ the error is raised If set to ‘raisedeprecating’

a FutureWarning is printed before the error is raised If a numeric value is given FitFailed

Warning is raised This parameter does not affect the refit step which will always raise the

error Default is ‘raisedeprecating’ but from version 022 it will change to nphan

Returns

scores dict of float arrays of shapensplits Array of scores of the estimator for each run of

the cross validation

A dict of arrays containing the scoretime arrays for each scorer is returned The possible

keys for this dict are

testscore The score array for test scores on each cv split

trainscore The score array for train scores on each cv split This is available

only ifreturntrainscore parameter is True

fittime The time for fitting the estimator on the train set for each cv split

scoretime The time for scoring the estimator on the test set for each cv

split Note time for scoring on the train set is not included even if

returntrainscore is set toTrue

2112 Chapter 6 API (Application Programming Interface) Reference

scikitlearn user guide Release 0213

estimator The estimator objects for each cv split This is available only if
returnestimator parameter is set to True

Generate crossvalidated estimates for each input data point

The data is split according to the cv parameter Each sample belongs to exactly one test set and its prediction is
computed with an estimator fitted on the corresponding training set

Passing these predictions into an evaluation metric may not be a valid way to measure generalization perfor
mance Results can differ from crossvalidate andcrossvalscore unless all tests sets have equal

size and the metric decomposes over samples

626sklearnmodelselection Model Selection 2113

scikitlearn user guide Release 0213

Read more in the User Guide

Parameters

estimator estimator object implementing ‘fit’ and ‘predict’ The object to use to fit the data

Xarraylike The data to fit Can be for example a list or an array at least 2d

yarraylike optional default None The target variable to try to predict in the case of supervised learning

groups arraylike with shape nsamples optional Group labels for the samples used while splitting the dataset into train/test set Only used in conjunction with a “Group” cvinstance eg GroupKFold

cvint crossvalidation generator or an iterable optional Determines the crossvalidation splitting strategy Possible inputs for cv are

- None to use the default 3fold cross validation
- integer to specify the number of folds in a StratifiedKFold
- CV (Cross-Validation) splitter
- An iterable yielding train test splits as arrays of indices

For integerNone inputs if the estimator is a classifier and y is either binary or multiclass

StratifiedKFold is used In all other cases KFold is used

Refer User Guide for the various crossvalidation strategies that can be used here

Changed in version 020 cvdefault value if None will change from 3fold to 5fold in v022

Determines crossvalidated training and test scores for different training set sizes

A crossvalidation generator splits the whole dataset k times in training and test data Subsets of the training set with varying sizes will be used to train the estimator and a score for each training subset size and the test set will be computed Afterwards the scores will be averaged over all k runs for each training subset size

Read more in the User Guide

Parameters

estimator object type that implements the “fit” and “predict” methods An object of that type which is cloned for each validation

Xarraylike shape nsamples nfeatures Training vector where nsamples is the number of samples and nfeatures is the number of features

yarraylike shape nsamples or nsamples nfeatures optional Target relative to X for classification or regression None for unsupervised learning

groups arraylike with shape nsamples optional Group labels for the samples used while splitting the dataset into traintest set Only used in conjunction with a “Group” cvinstance

egGroupKFold

scikitlearn user guide Release 0213

trainsizes arraylike shape n ticks dtype float or int Relative or absolute numbers of training examples that will be used to generate the learning curve If the dtype is float it is regarded as a fraction of the maximum size of the training set that is determined by the selected validation method ie it has to be within 0 1 Otherwise it is interpreted as absolute sizes of the training sets Note that for classification the number of samples usually have to be big enough to contain at least one sample from each class default nplinspace01 10 5

cv int crossvalidation generator or an iterable optional Determines the crossvalidation splitting strategy Possible inputs for cv are

- None to use the default 3fold cross validation
- integer to specify the number of folds in a StratifiedKFold
- CV (Cross-Validation) splitter
- An iterable yielding train test splits as arrays of indices

For integer None inputs if the estimator is a classifier and y is either binary or multiclass StratifiedKFold is used In all other cases KFold is used

Refer User Guide for the various crossvalidation strategies that can be used here

Changed in version 020 cv default value if None will change from 3fold to 5fold in v022

scoring string callable or None optional default None A string see model evaluation documentation or a scorer callable object function with signature scorer(estimator

X y

exploit incremental learning boolean optional default False If the estimator supports incremental learning this will be used to speed up fitting for different training set sizes

njobs int or None optional default None Number of jobs to run in parallel None means 1 unless in a joblibparallelbackend context 1 means using all processors See

Glossary for more details

pre_dispatch integer or string optional Number of pre-dispatched jobs for parallel execution default is all The option can reduce the allocated memory The string can be an expression like '2*njobs'

verbose integer optional Controls the verbosity the higher the more messages

shuffle boolean optional Whether to shuffle training data before taking prefixes of it based on 'trainsizes'

random_state int RandomState instance or None optional default None If int ran

dom_state is the seed used by the random number generator If RandomState instance

random_state is the random number generator If None the random number generator is

the RandomState instance used by nprandom Used when shuffle is True

error_score 'raise' 'raisedeprecating' or numeric Value to assign to the score if an error

occurs in estimator fitting If set to 'raise' the error is raised If set to 'raisedeprecating'

a FutureWarning is printed before the error is raised If a numeric value is given FitFailed

Warning is raised This parameter does not affect the refit step which will always raise the

error Default is 'raisedeprecating' but from version 022 it will change to npran

Returns

trainsizes abs array shape n unique ticks dtype int Numbers of training examples that

has been used to generate the learning curve Note that the number of ticks might be less than n_ticks because duplicate entries will be removed

627sklearnmulticlass Multiclass and multilabel classification

6271 Multiclass and multilabel classification strategies

This module implements multiclass learning algorithms

- onevstherest onevsall
- onevsone
- error correcting output codes

The estimators provided in this module are metaestimators they require a base estimator to be provided in their constructor For example it is possible to use these estimators to turn a binary classifier or a regressor into a multiclass classifier It is also possible to use these estimators with multiclass estimators in the hope that their accuracy or runtime performance improves

All classifiers in scikitlearn implement multiclass classification you only need to use this module if you want to experiment with custom multiclass strategies

The onevstherest metaclassifier also implements a predictproba method so long as such a method is implemented by the base classifier This method returns probabilities of class membership in both the single label and multilabel case Note that in the multilabel case probabilities are the marginal probability that a given sample falls in the given class As such in the multilabel case the sum of these probabilities over all possible labels for a given sample will not sum to unity as they do in the single label case

User guide See the Multiclass and multilabel algorithms section for further details

multiclassOneVsRestClassifier estimator

ErrorCorrecting OutputCode multiclass strategy

6272sklearnmulticlass OneVsRestClassifier

classsklearnmulticlass OneVsRestClassifier estimator njobsNone

Onevstherest OvR multiclassmultilabel strategy

Also known as onevsall this strategy consists in fitting one classifier per class For each classifier the class is

2122 Chapter 6 API (Application Programming Interface) Reference

scikitlearn user guide Release 0213

fitted against all the other classes In addition to its computational efficiency only nclasses classifiers are needed one advantage of this approach is its interpretability Since each class is represented by one and one classifier only it is possible to gain knowledge about the class by inspecting its corresponding classifier This is the most commonly used strategy for multiclass classification and is a fair default choice This strategy can also be used for multilabel learning where a classifier is used to predict multiple labels for instance by fitting on a 2d matrix in which cell i j is 1 if sample i has label j and 0 otherwise In the multilabel learning literature OvR is also known as the binary relevance method

Read more in the User Guide

Parameters

estimator estimator object An estimator object implementing fit and one of decisionfunction or predict_proba
njobs int or None optional default None The number of jobs to use for the computation
None means 1 unless in a joblibparallelbackend context 1 means using all processors See Glossary for more details

Attributes

estimators list of nclasses estimators Estimators used for predictions
classes array shape (nclasses) Class labels
labelbinarizer LabelBinarizer object Object used to transform multiclass labels to binary labels and viceversa
multilabel boolean Whether this is a multilabel classifier

Methods

decisionfunction self X Returns the distance of each sample from the decision boundary for each class
fitself X y Fit underlying estimators
getparams self deep Get parameters for this estimator
partialfit self X y classes Partially fit underlying estimators
predict self X Predict multiclass targets using underlying estimators
predict_proba self X Probability estimates
score self X y sampleweight Returns the mean accuracy on the given test data and labels
setparams self params Set the parameters of this estimator
init self estimator njobs None
decisionfunction self X

Returns the distance of each sample from the decision boundary for each class This can only be used with estimators which implement the decisionfunction method

Parameters

X arraylike shape (nsamples, nfeatures)

Returns

T arraylike shape (nsamples, nclasses)

fitself X y

627 sklearnmulticlass Multiclass and multilabel classification 2123

scikitlearn user guide Release 0213

Fit underlying estimators

Parameters

Xsparse arraylike shape nsamples nfeatures Data

ysparse arraylike shape nsamples nsamples nclasses Multiclass targets

An indicator matrix turns on multilabel classification

Returns

self

getparams selfdeepTrue

Get parameters for this estimator

Parameters

deep boolean optional If True will return the parameters for this estimator and contained

subobjects that are estimators

Returns

params mapping of string to any Parameter names mapped to their values

multilabel

Whether this is a multilabel classifier

partialfit selfXyclassesNone

Partially fit underlying estimators

Should be used when memory is inefficient to train all data Chunks of data can be passed in several

iteration

Parameters

Xsparse arraylike shape nsamples nfeatures Data

ysparse arraylike shape nsamples nsamples nclasses Multiclass targets

An indicator matrix turns on multilabel classification

classes array shape nclasses Classes across all calls to partialfit Can be obtained

vianpuniqueyall where yall is the target vector of the entire dataset This

argument is only required in the first call of partialfit and can be omitted in the subsequent

calls

Returns

self

predictselfX

Predict multiclass targets using underlying estimators

Parameters

Xsparse arraylike shape nsamples nfeatures Data

Returns

ysparse arraylike shape nsamples nsamples nclasses Predicted multiclass

targets

predictproba selfX

Probability estimates

The returned estimates for all classes are ordered by label of classes

2124 Chapter 6 API (Application Programming Interface) Reference

scikitlearn user guide Release 0213

Note that in the multilabel case each sample can have any number of labels This returns the marginal probability that the given sample has the label in question For example it is entirely consistent that two labels both have a 90 probability of applying to a given sample

In the single label multiclass case the rows of the returned matrix sum to 1

Parameters

Xarraylike shape nsamples nfeatures

Returns

Tsparse arraylike shape nsamples nclasses Returns the probability of the sample for each class in the model where classes are ordered as they are in selfclasses

scoreselfXysampleweightNone

Returns the mean accuracy on the given test data and labels

In multilabel classification this is the subset accuracy which is a harsh metric since you require for each sample that each label set be correctly predicted

Parameters

Xarraylike shape nsamples nfeatures Test samples

yarraylike shape nsamples or nsamples noutputs True labels for X

sampleweight arraylike shape nsamples optional Sample weights

Returns

score float Mean accuracy of selfpredictX wrt y

setparams selfparams

Set the parameters of this estimator

The method works on simple estimators as well as on nested objects such as pipelines The latter have parameters of the form componentparameter so that it's possible to update each component of a nested object

Returns

self

Examples using sklearnmulticlassOneVsRestClassifier

- Multilabel classification
- Receiver Operating Characteristic ROC
- PrecisionRecall
- Classifier Chain

6273sklearnmulticlass OneVsOneClassifier

classssklearnmulticlass OneVsOneClassifier estimator njobsNone

Onevsone multiclass strategy

This strategy consists in fitting one classifier per class pair At prediction time the class which received the most votes is selected Since it requires to fit nclasses nclasses 1 2 classifiers this method

is usually slower than onevstherest due to its Onclasses2 complexity However this method may be advantageous for algorithms such as kernel algorithms which don't scale well with nsamples This is because 6273sklearnmulticlass Multiclass and multilabel classification 2125

scikitlearn user guide Release 0213

each individual learning problem only involves a small subset of the data whereas with onevs therest the complete dataset is used nclasses times

Read more in the User Guide

Parameters

estimator estimator object An estimator object implementing fit and one of decisionfunction or predict_proba

njobs int or None optional default None The number of jobs to use for the computation

None means 1 unless in a joblibparallelbackend context 1 means using all processors See Glossary for more details

Attributes

estimators list of nclasses nclasses 1 2 estimators Estimators used for predictions

classes numpy array of shape nclasses Array containing labels

pairwiseindices list length len(estimators) or None Indices of samples used when training the estimators None when estimator does not have pairwise attribute

Methods

decisionfunction self X Decision function for the OneVsOneClassifier

fitself X y Fit underlying estimators

getparams self deep Get parameters for this estimator

partialfit self X y classes Partially fit underlying estimators

predict self X Estimate the best class label for each sample in X

score self X y sampleweight Returns the mean accuracy on the given test data and labels

setparams self params Set the parameters of this estimator

init self estimator njobs None

decisionfunction self X

Decision function for the OneVsOneClassifier

The decision values for the samples are computed by adding the normalized sum of pairwise classification confidence levels to the votes in order to disambiguate between the decision values when the votes for all the classes are equal leading to a tie

Parameters

Xarraylike shape nsamples nfeatures

Returns

Yarraylike shape nsamples nclasses

fitself X y

Fit underlying estimators

Parameters

Xsparse arraylike shape nsamples nfeatures Data

yarraylike shape nsamples Multiclass targets

2126 Chapter 6 API (Application Programming Interface) Reference

scikitlearn user guide Release 0213

Returns

self

getparams selfdeepTrue

Get parameters for this estimator

Parameters

deep boolean optional If True will return the parameters for this estimator and contained

subobjects that are estimators

Returns

params mapping of string to any Parameter names mapped to their values

partialfit selfXyclassesNone

Partially fit underlying estimators

Should be used when memory is inefficient to train all data Chunks of data can be passed in several

iteration where the first call should have an array of all target variables

Parameters

Xsparse arraylike shape nsamples nfeatures Data

yarraylike shape nsamples Multiclass targets

classes array shape nclasses Classes across all calls to partialfit Can be obtained

via np.unique(yall) where yall is the target vector of the entire dataset This

argument is only required in the first call of partialfit and can be omitted in the subsequent

calls

Returns

self

predictselfX

Estimate the best class label for each sample in X

This is implemented as argmax(decision_function(X, axis=1)) which will return the label

of the class with most votes by estimators predicting the outcome of a decision for each possible class pair

Parameters

Xsparse arraylike shape nsamples nfeatures Data

Returns

numpy array of shape nsamples Predicted multiclass targets

scoreselfXysampleweightNone

Returns the mean accuracy on the given test data and labels

In multilabel classification this is the subset accuracy which is a harsh metric since you require for each

sample that each label set be correctly predicted

Parameters

Xarraylike shape nsamples nfeatures Test samples

yarraylike shape nsamples or nsamples noutputs True labels for X

sampleweight arraylike shape nsamples optional Sample weights

Returns

score float Mean accuracy of selfpredictX wrt y

627sklearnmulticlass Multiclass and multilabel classification 2127

scikitlearn user guide Release 0213

setparams selfparams

Set the parameters of this estimator

The method works on simple estimators as well as on nested objects such as pipelines The latter have parameters of the form componentparameter so that it's possible to update each component of a nested object

Returns

self

6274sklearnmulticlass OutputCodeClassifier

classsklearnmulticlass OutputCodeClassifier estimator codesize15 ran

domstateNone njobsNone

ErrorCorrecting OutputCode multiclass strategy

Outputcode based strategies consist in representing each class with a binary code an array of 0s and 1s At fitting time one binary classifier per bit in the code book is fitted At prediction time the classifiers are used to project new points in the class space and the class closest to the points is chosen The main advantage of these strategies is that the number of classifiers used can be controlled by the user either for compressing the model 0 codesize 1 or for making the model more robust to errors codesize 1 See the documentation for

more details

Read more in the User Guide

Parameters

estimator estimator object An estimator object implementing fit and one of

decisionfunction orpredictproba

codesize float Percentage of the number of classes to be used to create the code book A number between 0 and 1 will require fewer classifiers than onevstherest A number greater than 1 will require more classifiers than onevstherest

randomstate int RandomState instance or None optional default None The generator used to initialize the codebook If int randomstate is the seed used by the random number generator If RandomState instance randomstate is the random number generator If None the random number generator is the RandomState instance used by nprandom

njobs int or None optional defaultNone The number of jobs to use for the computation

None means 1 unless in a joblibparallelbackend context1means using all

processors See Glossary for more details

A multilabel model that arranges regressions into a chain

6281sklearnmultioutput ClassifierChain

classsklearnmultioutput ClassifierChain baseestimator orderNone cvNone ran
domstateNone

A multilabel model that arranges binary classifiers into a chain

Each model makes a prediction in the order specified by the chain using all of the available features provided to the model plus the predictions of models that are earlier in the chain

Read more in the User Guide

Parameters

baseestimator estimator The base estimator from which the classifier chain is built

order arraylike shapenoutputs or ‘random’ optional By default the order will be deter
mined by the order of columns in the label matrix Y

order 0 1 2 Yshape1 1

The order of the chain can be explicitly set by providing a list of integers For example for
a chain of length 5

order 1 3 2 4 0

means that the first model in the chain will make predictions for column 1 in the Y matrix
the second model will make predictions for column 3 etc

2130 Chapter 6 API (Application Programming Interface) Reference

scikitlearn user guide Release 0213

If order is 'random' a random ordering will be used
cvint crossvalidation generator or an iterable optional defaultNone Determines whether to use cross validated predictions or true labels for the results of previous estimators in the chain If cv is None the true labels are used when fitting Otherwise possible inputs for cv are

- integer to specify the number of folds in a StratifiedKFold
- CV (Cross-Validation) splitter
- An iterable yielding train test splits as arrays of indices

randomstate int RandomState instance or None optional defaultNone If int ran
domstate is the seed used by the random number generator If RandomState instance
randomstate is the random number generator If None the random number generator is
the RandomState instance used by nprandom

The random number generator is used to generate random chain orders

Attributes

classes list A list of arrays of length lenestimators containing the class labels for
each estimator in the chain

estimators list A list of clones of baseestimator

order list The order of labels in the classifier chain

classsklearnnaivebayes BernoulliNB alpha10 binarize00 fitpriorTrue

classpriorNone

Naive Bayes classifier for multivariate Bernoulli models

Like MultinomialNB this classifier is suitable for discrete data The difference is that while MultinomialNB works with occurrence counts BernoulliNB is designed for binaryboolean features

Read more in the User Guide

Parameters

alpha float optional default10 Additive LaplaceLidstone smoothing parameter 0 for no smoothing

binarize float or None optional default00 Threshold for binarizing mapping to booleans

of sample features If None input is presumed to already consist of binary vectors

fitprior boolean optional defaultTrue Whether to learn class prior probabilities or not If false a uniform prior will be used

classprior arraylike sizenclasses optional defaultNone Prior probabilities of the classes If specified the priors are not adjusted according to the data

Attributes

classlogprior array shape nclasses Log probability of each class smoothed

featurelogprob array shape nclasses nfeatures Empirical log probability of fea tures given a class Pxiy

classcount array shape nclasses Number of samples encountered for each class during fitting This value is weighted by the sample weight when provided

2140 Chapter 6 API (Application Programming Interface) Reference

Examples

```
import numpy as np
X = np.random.randint(2, size=(6, 100))
Y = np.array([2, 3, 4, 4, 5])
from sklearn.naive_bayes import BernoulliNB
clf = BernoulliNB()
clf.fit(X, Y)
BernoulliNB(alpha=1.0, binarize=0.0, class_prior=None, fit_prior=True)
print(clf.predict(X[2:3]))
```

Methods

fit(self, X, y, sample_weight) Fit Naive Bayes classifier according to X, y
get_params(self, deep=True) Get parameters for this estimator
partial_fit(self, X, y, classes, sample_weight) Incremental fit on a batch of samples
predict(self, X) Perform classification on an array of test vectors X
predict_log_proba(self, X) Return log-probability estimates for the test vector X
predict_proba(self, X) Return probability estimates for the test vector X
score(self, X, y, sample_weight) Returns the mean accuracy on the given test data and labels
set_params(self, **params) Set the parameters of this estimator
init(self, alpha=1.0, binarize=0.0, fit_prior=True, class_prior=None)
fit(self, X, y, sample_weight=None)
Fit Naive Bayes classifier according to X, y

Parameters

X array-like, sparse matrix shape (n_samples, n_features) Training vectors, where n_samples is the number of samples and n_features is the number of features
y array-like shape (n_samples) Target values
sample_weight array-like shape (n_samples) default=None Weights applied to individual samples (1 for unweighted)

scikitlearn user guide Release 0213

Returns

self object

getparams selfdeepTrue

Get parameters for this estimator

Parameters

deep boolean optional If True will return the parameters for this estimator and contained

subobjects that are estimators

Returns

params mapping of string to any Parameter names mapped to their values

partialfit selfXyclassesNone sampleweightNone

Incremental fit on a batch of samples

This method is expected to be called several times consecutively on different chunks of a dataset so as to

implement outofcore or online learning

This is especially useful when the whole dataset is too big to fit in memory at once

This method has some performance overhead hence it is better to call partialfit on chunks of data that are

as large as possible as long as fitting in the memory budget to hide the overhead

Parameters

Xarraylike sparse matrix shape nsamples nfeatures Training vectors where

nsamples is the number of samples and nfeatures is the number of features

yarraylike shape nsamples Target values

classes arraylike shape nclasses defaultNone List of all the classes that can pos

sibly appear in the y vector

Must be provided at the first call to partialfit can be omitted in subsequent calls

sampleweight arraylike shape nsamples defaultNone Weights applied to indi

vidual samples 1 for unweighted

Returns

self object

predictselfX

Perform classification on an array of test vectors X

Parameters

Xarraylike shape nsamples nfeatures

Returns

Carray shape nsamples Predicted target values for X

predictlogproba selfX

Return logprobability estimates for the test vector X

Parameters

Xarraylike shape nsamples nfeatures

Returns

2142 Chapter 6 API (Application Programming Interface) Reference

scikitlearn user guide Release 0213

Carraylike shape nsamples nclasses Returns the logprobability of the samples for each class in the model The columns correspond to the classes in sorted order as they appear in the attribute classes

predictproba selfX

Return probability estimates for the test vector X

Parameters

Xarraylike shape nsamples nfeatures

Returns

Carraylike shape nsamples nclasses Returns the probability of the samples for each class in the model The columns correspond to the classes in sorted order as they appear in the attribute classes

scoreselfXysampleweightNone

Returns the mean accuracy on the given test data and labels

In multilabel classification this is the subset accuracy which is a harsh metric since you require for each sample that each label set be correctly predicted

Parameters

Xarraylike shape nsamples nfeatures Test samples

yarraylike shape nsamples or nsamples noutputs True labels for X

sampleweight arraylike shape nsamples optional Sample weights

Returns

score float Mean accuracy of selfpredictX wrt y

setparams selfparams

Set the parameters of this estimator

The method works on simple estimators as well as on nested objects such as pipelines The latter have parameters of the form componentparameter so that it's possible to update each component of a nested object

Returns

self

Examples using sklearnnaivebayesBernoulliNB

•Hashing feature transformation using Totally Random Trees

•Classification of text documents using sparse features

6293sklearnnaivebayes MultinomialNB

classsklearnnaivebayes MultinomialNB alpha10 fitpriorTrue classpriorNone

Naive Bayes classifier for multinomial models

The multinomial Naive Bayes classifier is suitable for classification with discrete features eg word counts for text classification The multinomial distribution normally requires integer feature counts However in practice fractional counts such as tfidf may also work

Read more in the User Guide

Parameters

alpha float optional default10 Additive LaplaceLidstone smoothing parameter 0 for no smoothing

fitprior boolean optional defaultTrue Whether to learn class prior probabilities or not If false a uniform prior will be used

classprior arraylike size nclasses optional defaultNone Prior probabilities of the classes If specified the priors are not adjusted according to the data

Attributes

classlogprior array shape nclasses Smoothed empirical log probability for each class

intercept array shape nclasses Mirrors classlogprior for interpreting MultinomialNB as a linear model

featurelogprob array shape nclasses nfeatures Empirical log probability of features given a class Pxiy

coef array shape nclasses nfeatures Mirrors featurelogprob for interpreting MultinomialNB as a linear model

classcount array shape nclasses Number of samples encountered for each class during fitting This value is weighted by the sample weight when provided

featurecount array shape nclasses nfeatures Number of samples encountered for each class feature during fitting This value is weighted by the sample weight when provided

Notes

For the rationale behind the names coef andintercept ie naive Bayes as a linear classifier see J Rennie et al 2003 Tackling the poor assumptions of naive Bayes text classifiers ICML

Parameters

Xarraylike shape nsamples nfeatures An array of points to query

kinteger default 1 The number of nearest neighbors to return

returndistance boolean default True if True return a tuple d i of distances and

indices if False return array i

2156 Chapter 6 API (Application Programming Interface) Reference

scikitlearn user guide Release 0213

dualtree boolean default False if True use the dual tree formalism for the query a tree is built for the query points and the pair of trees is used to efficiently search this space This can lead to better performance as the number of points grows large
breadthfirst boolean default False if True then query the nodes in a breadthfirst manner Otherwise query the nodes in a depthfirst manner
sortresults boolean default True if True then distances and indices of each point are sorted on return so that the first column contains the closest points Otherwise neighbors are returned in an arbitrary order

Returns

iif returndistance False
di if returndistance True
darray of doubles shape xshape1 k each entry gives the list of distances to the neighbors of the corresponding point
iarray of integers shape xshape1 k each entry gives the list of indices of neighbors of the corresponding point
queryradius
queryradiusself X r countonly False
query the tree for neighbors within a radius r

Parameters

Xarraylike shape nsamples nfeatures An array of points to query
rdistance within which neighbors are returned r can be a single value or an array of values of shape xshape1 if different radii are desired for each point
returndistance boolean default False if True return distances to neighbors of each point if False return only neighbors Note that unlike the query method setting returndistanceTrue here adds to the computation time Not all distances need to be calculated explicitly for returndistanceFalse Results are not sorted by default see sortresults keyword
countonly boolean default False if True return only the count of points within distance r if False return the indices of all points within distance r If returndistanceTrue setting countonlyTrue will result in an error
sortresults boolean default False if True the distances and indices will be sorted before being returned If False the results will not be sorted If returndistance False setting sortresults True will result in an error

Returns

count if countonly True
ind if countonly False and returndistance False
ind dist if countonly False and returndistance True
count array of integers shape Xshape1 each entry gives the number of neighbors within a distance r of the corresponding point
ind array of objects shape Xshape1 each element is a numpy integer array listing the indices of neighbors of the corresponding point Note that unlike the results of a k neighbors query the returned neighbors are not sorted by distance by default
630sklearnneighbors Nearest Neighbors 2157

scikitlearn user guide Release 0213

dist array of objects shape Xshape1 each element is a numpy double array listing the distances corresponding to indices in i

twopointcorrelation

Compute the twopoint correlation function

Parameters

Xarraylike shape nsamples nfeatures An array of points to query Last dimension should match dimension of training data

rarraylike A onedimensional array of distances

dualtree boolean default False If true use a dualtree algorithm Otherwise use a singletree algorithm Dual tree algorithms can have better scaling for large N

Returns

counts ndarray counts[i] contains the number of pairs of points with distance less than or equal to ri

6302sklearnneighbors DistanceMetric

classsklearnneighbors DistanceMetric

DistanceMetric class

This class provides a uniform interface to fast distance metric functions The various metrics can be accessed via thegetmetric class method and the metric string identifier see below For example to use the Euclidean distance

dist DistanceMetricgetmetriceuclidean

X 0 1 2

3 4 5

distpairwiseX

array 0 519615242

519615242 0

Available Metrics

The following lists the string metric identifiers and the associated distance metric classes

Metrics intended for realvalued vector spaces

2158 Chapter 6 API (Application Programming Interface) Reference

scikitlearn user guide Release 0213

identifier class name args distance function

“euclidean” EuclideanDistance

•sqrtsumx

y2

“manhattan” ManhattanDistance

•sumx y

“chebyshev” ChebyshevDistance

•maxx y

“minkowski” MinkowskiDistance p sumx

yp1p

“wminkowski” WMinkowskiDistance p w sumwx

yp1p

“seuclidean” SEuclideanDistance V sqrtsumx

y2 V

“mahalanobis” MahalanobisDistance V or VI sqrtx y

V1 x y

Metrics intended for twodimensional vector spaces Note that the haversine distance metric requires data in

the form of latitude longitude and both inputs and outputs are in units of radians

identifier class name distance function

“haver

sine”HaversineDis

tance2 arcsinsqrtsin205 dx

cosx1cosx2sin205 dy

Metrics intended for integervalued vector spaces Though intended for integervalued vectors these are also

valid metrics in the case of realvalued vectors

identifier class name distance function

“hamming” HammingDistance Nunequalx y Ntot

“canberra” CanberraDistance sumx y x y

“braycurtis” BrayCurtisDistance sumx y sumx sumy

Metrics intended for booleanvalued vector spaces Any nonzero entry is evaluated to “True” In the listings

below the following abbreviations are used

- N number of dimensions
 - NTT number of dims in which both values are True
 - NTF number of dims in which the first value is True second is False
 - NFT number of dims in which the first value is False second is True
 - NFF number of dims in which both values are False
 - NNEQ number of nonequal dimensions NNEQ NTF NFT
 - NNZ number of nonzero dimensions NNZ NTF NFT NTT
- 630sklearnneighbors Nearest Neighbors 2159

scikitlearn user guide Release 0213

identifier class name distance function

"jaccard" JaccardDistance NNEQ NNZ

"matching" MatchingDistance NNEQ N

"dice" DiceDistance NNEQ NTT NNZ

"kulsinski" KulsinskiDistance NNEQ N NTT NNEQ N

"rogerstanimoto" RogersTanimotoDistance 2 NNEQ N NNEQ

"russellrao" RussellRaoDistance NNZ N

"sokalmichener" SokalMichenerDistance 2 NNEQ N NNEQ

"sokalsneath" SokalSneathDistance NNEQ NNEQ 05 NTT

Userdefined distance

identifier class name args

"pyfunc" PyFuncDistance func

Herefunc is a function which takes two onedimensional numpy arrays and returns a distance Note that in order to be used within the BallTree the distance must be a true metric ie it must satisfy the following properties

1 Nonnegativity $dx \geq 0$

2 Identity $dx = 0$ if and only if $x = y$

3 Symmetry $dx_{y \rightarrow dy} = x$

4 Triangle Inequality $dx_{y \rightarrow dy} \leq z \rightarrow dx \leq z$

Because of the Python object overhead involved in calling the python function this will be fairly slow but it will have the same scaling as other distances

Methods

disttordist Convert the true distance to the reduced distance

getmetric Get the given distance metric from the string identifier

pairwise Compute the pairwise distances between X and Y

rdisttodist Convert the Reduced distance to the true distance

init selfargs kwargs

Initialize self See helptypeself for accurate signature

disttordist

Convert the true distance to the reduced distance

The reduced distance defined for some metrics is a computationally more efficient measure which preserves the rank of the true distance For example in the Euclidean distance metric the reduced distance is the squaredeuclidean distance

getmetric

Get the given distance metric from the string identifier

See the docstring of DistanceMetric for a list of available metrics

Parameters

metric string or class name The distance metric to use

2160 Chapter 6 API (Application Programming Interface) Reference

scikitlearn user guide Release 0213

kwargs additional arguments will be passed to the requested metric

pairwise

Compute the pairwise distances between X and Y

This is a convenience routine for the sake of testing For many metrics the utilities in

scipyspatialdistancecdist and scipyspatialdistancepdist will be faster

Parameters

Xarraylike Array of shape Nx D representing Nx points in D dimensions

Yarraylike optional Array of shape Ny D representing Ny points in D dimensions

If not specified then YX

Returns

dist ndarray The shape Nx Ny array of pairwise distances between points in X and Y

rdisttodist

Convert the Reduced distance to the true distance

The reduced distance defined for some metrics is a computationally more efficient measure which pre

serves the rank of the true distance For example in the Euclidean distance metric the reduced distance is

the squaredeuclidean distance

6303sklearnneighbors KDTree

classsklearnneighbors KDTree

KDTree for fast generalized Npoint problems

KDTreeX leafsize40 metric'minkowski' kwargs

Parameters

Xarraylike shape nsamples nfeatures nsamples is the number of points in the data

set and nfeatures is the dimension of the parameter space Note if X is a Ccontiguous

array of doubles then data will not be copied Otherwise an internal copy will be made

leafsize positive integer default 40 Number of points at which to switch to bruteforce

Changing leafsize will not affect the results of a query but can significantly impact the

speed of a query and the memory required to store the constructed tree The amount of

memory needed to store the tree scales as approximately nsamples leafsize For a spec

ifiedleafsize a leaf node is guaranteed to satisfy leafsize npoints

2leafsize except in the case that nsamples leafsize

metric string or DistanceMetric object the distance metric to use for the tree De

fault'minkowski' with p2 that is a euclidean metric See the documentation of the

DistanceMetric class for a list of available metrics kdtreevalidmetrics gives a list of the

metrics which are valid for KDTree

Additional keywords are passed to the distance metric class

Attributes

data memory view The training data

6303sklearnneighbors Nearest Neighbors 2161

scikitlearn user guide Release 0213

Examples

Query for knearest neighbors

```
import numpy as np
rng = np.random.RandomState(0)
X = rng.random_sample(10, 3)  # 10 points in 3 dimensions
tree = KDTree(X, leafsize=2)
dist, ind = tree.query(X[1], k=3)
print(ind)  # indices of 3 closest neighbors
0 3 1
print(dist)  # distances to 3 closest neighbors
0 0.19662693 0.29473397
```

Pickle and Unpickle a tree Note that the state of the tree is saved in the pickle operation the tree needs not be rebuilt upon unpickling

```
import numpy as np
import pickle
rng = np.random.RandomState(0)
X = rng.random_sample(10, 3)  # 10 points in 3 dimensions
tree = KDTree(X, leafsize=2)
s = pickle.dumps(tree)
tree_copy = pickle.loads(s)
dist, ind = tree_copy.query(X[1], k=3)
print(ind)  # indices of 3 closest neighbors
0 3 1
print(dist)  # distances to 3 closest neighbors
0 0.19662693 0.29473397
```

Query for neighbors within a given radius

```
import numpy as np
rng = np.random.RandomState(0)
X = rng.random_sample(10, 3)  # 10 points in 3 dimensions
tree = KDTree(X, leafsize=2)
print(tree.query_radius(X[1], r=0.3, count_only=True))
3
ind, tree.query_radius(X[1], r=0.3)
print(ind)  # indices of neighbors within distance 0.3
3 0 1
```

Compute a gaussian kernel density estimate

```
import numpy as np
rng = np.random.RandomState(42)
X = rng.random_sample(100, 3)
tree = KDTree(X)
tree.kernel_density(X[3], h=0.1, kernel=gaussian)
array(6.94114649 7.83281226 7.2071716)
```

Compute a twopoint autocorrelation function

```
import numpy as np
rng = np.random.RandomState(0)
X = rng.random_sample(30, 3)
r = np.linspace(0, 1, 5)
tree = KDTree(X)
```

scikitlearn user guide Release 0213

getncalls

gettreestats

resetncalls

init selfargs kwargs

Initialize self See helptypeself for accurate signature

kerneldensity selfXhkernel'gaussian' atol0 rtol1E8 breadthfirstTrue re

turnlogFalse

Compute the kernel density estimate at points X with the given kernel using the distance metric specified

at tree creation

Parameters

Xarraylike shape nsamples nfeatures An array of points to query Last dimension

should match dimension of training data

hfloat the bandwidth of the kernel

kernel string specify the kernel to use Options are 'gaussian' 'tophat' 'epanechnikov' 'exponential' 'linear' 'cosine' Default is kernel 'gaussian'

atol rtol float default 0 Specify the desired relative and absolute tolerance of the result If the true result is Ktrue then the returned result Kret satisfies absKtrue

Kret atol rtol Kret The default is zero ie machine precision for both

breadthfirst boolean default False if True use a breadthfirst search If False default

use a depthfirst search Breadthfirst is generally faster for compact kernels andor high tolerances

returnlog boolean default False return the logarithm of the result This can be more accurate than returning the result itself for narrow kernels

Returns

density ndarray The array of logdensity evaluations shape Xshape1

queryXk1returndistanceTrue dualtreeFalse breadthfirstFalse

query the tree for the k nearest neighbors

Parameters

630sklearnneighbors Nearest Neighbors 2163

scikitlearn user guide Release 0213

Xarraylike shape nsamples nfeatures An array of points to query
kinteger default 1 The number of nearest neighbors to return
returndistance boolean default True if True return a tuple d i of distances and indices if False return array i
dualtree boolean default False if True use the dual tree formalism for the query a tree is built for the query points and the pair of trees is used to efficiently search this space This can lead to better performance as the number of points grows large
breadthfirst boolean default False if True then query the nodes in a breadthfirst manner Otherwise query the nodes in a depthfirst manner
sortresults boolean default True if True then distances and indices of each point are sorted on return so that the first column contains the closest points Otherwise neighbors are returned in an arbitrary order
Returns
iif returndistance False
di if returndistance True
darray of doubles shape xshape1 k each entry gives the list of distances to the neighbors of the corresponding point
iarray of integers shape xshape1 k each entry gives the list of indices of neighbors of the corresponding point
queryradius
queryradiusself X r countonly False
query the tree for neighbors within a radius r
Parameters
Xarraylike shape nsamples nfeatures An array of points to query
rdistance within which neighbors are returned r can be a single value or an array of values of shape xshape1 if different radii are desired for each point
returndistance boolean default False if True return distances to neighbors of each point if False return only neighbors Note that unlike the query method setting returndistanceTrue here adds to the computation time Not all distances need to be calculated explicitly for returndistanceFalse Results are not sorted by default see sortresults keyword
countonly boolean default False if True return only the count of points within distance r if False return the indices of all points within distance r If returndistanceTrue setting countonlyTrue will result in an error
sortresults boolean default False if True the distances and indices will be sorted before being returned If False the results will not be sorted If returndistance False setting sortresults True will result in an error
Returns
count if countonly True
ind if countonly False and returndistance False
ind dist if countonly False and returndistance True

scikitlearn user guide Release 0213

count array of integers shape Xshape1 each entry gives the number of neighbors within a distance r of the corresponding point
ind array of objects shape Xshape1 each element is a numpy integer array listing the indices of neighbors of the corresponding point Note that unlike the results of a k neighbors query the returned neighbors are not sorted by distance by default
dist array of objects shape Xshape1 each element is a numpy double array listing the distances corresponding to indices in i
twopointcorrelation

Compute the twopoint correlation function

Parameters

Xarraylike shape nsamples nfeatures An array of points to query Last dimension should match dimension of training data

rarraylike A onedimensional array of distances

dualtree boolean default False If true use a dualtree algorithm Otherwise use a singletree algorithm Dual tree algorithms can have better scaling for large N

Returns

counts ndarray counts[i] contains the number of pairs of points with distance less than or equal to r[i]

6304sklearnneighbors KernelDensity

classsklearnneighbors KernelDensity bandwidth10 algorithm'auto' kernel'gaussian'

metric'euclidean' atol0 rtol0 breadthfirstTrue

leafsize40 metricparamsNone

Kernel Density Estimation

Read more in the User Guide

Parameters

bandwidth float The bandwidth of the kernel

algorithm string The tree algorithm to use Valid options are 'kdtree''balltree''auto'

Default is 'auto'

kernel string The kernel to use Valid kernels are 'gaus

sian''tophat''epanechnikov''exponential''linear''cosine' Default is 'gaussian'

metric string The distance metric to use Note that not all metrics are valid with all algorithms

Refer to the documentation of BallTree andKDTree for a description of available algo

rithms Note that the normalization of the density output is correct only for the Euclidean

distance metric Default is 'euclidean'

atol float The desired absolute tolerance of the result A larger tolerance will generally lead

to faster execution Default is 0

rtol float The desired relative tolerance of the result A larger tolerance will generally lead to

faster execution Default is 1E8

breadthfirst boolean If true default use a breadthfirst approach to the problem Otherwise

use a depthfirst approach

leafsize int Specify the leaf size of the underlying tree See BallTree orKDTree for

details Default is 40

630sklearnneighbors Nearest Neighbors 2165

scikitlearn user guide Release 0213

metricparams dict Additional parameters to be passed to the tree for use with the metric
For more information see the documentation of BallTree orKDTree

Methods

fitself X y sampleweight Fit the Kernel Density model on the data

getparams self deep Get parameters for this estimator

sample self nsamples randomstate Generate random samples from the model

score self X y Compute the total log probability density under the model

scoresamples self X Evaluate the density model on the data

setparams self params Set the parameters of this estimator

init selfbandwidth10 algorithm'auto' kernel'gaussian' metric'euclidean' atol0
rtol0 breadthfirstTrue leafsize40 metricparamsNone

fitselfXyNone sampleweightNone

Fit the Kernel Density model on the data

Parameters

Xarraylike shape nsamples nfeatures List of nfeaturesdimensional data points
Each row corresponds to a single data point

sampleweight arraylike shape nsamples optional List of sample weights attached to the data X

getparams selfdeepTrue

Get parameters for this estimator

Parameters

deep boolean optional If True will return the parameters for this estimator and contained subobjects that are estimators

Returns

params mapping of string to any Parameter names mapped to their values

sampleselfnsamples1 randomstateNone

Generate random samples from the model

Currently this is implemented only for gaussian and tophat kernels

Parameters

nsamples int optional Number of samples to generate Defaults to 1

randomstate int RandomState instance or None default to None If int randomstate is the seed used by the random number generator If RandomState instance randomstate is the random number generator If None the random number generator is the RandomState instance used by nprandom

Returns

Xarraylike shape nsamples nfeatures List of samples

scoreselfXyNone

Compute the total log probability density under the model

Parameters

2166 Chapter 6 API (Application Programming Interface) Reference

scikitlearn user guide Release 0213

Xarraylike shape nsamples nfeatures List of nfeaturesdimensional data points

Each row corresponds to a single data point

Returns

logprob float Total loglikelihood of the data in X This is normalized to be a probability density so the value will be low for highdimensional data

scoresamples selfX

Evaluate the density model on the data

Parameters

Xarraylike shape nsamples nfeatures An array of points to query Last dimension

should match dimension of training data nfeatures

Returns

density ndarray shape nsamples The array of logdensity evaluations These are normalized to be probability densities so values will be low for highdimensional data

setparams selfparams

Set the parameters of this estimator

The method works on simple estimators as well as on nested objects such as pipelines The latter have parameters of the form componentparameter so that it's possible to update each component of a nested object

Returns

self

Examples using sklearnneighborsKernelDensity

- Kernel Density Estimation
- Kernel Density Estimate of Species Distributions
- Simple 1D Kernel Density Estimation

6305sklearnneighbors KNeighborsClassifier

classssklearnneighbors KNeighborsClassifier nneighbors5 weights'uniform' al

gorithm'auto' leafsize30 p2met

ric'minkowski' metricparamsNone

njobsNone kwargs

Classifier implementing the knearest neighbors vote

Read more in the User Guide

Parameters

nneighbors int optional default 5 Number of neighbors to use by default for

kneighbors queries

weights str or callable optional default 'uniform' weight function used in prediction Possible values

- 'uniform' uniform weights All points in each neighborhood are weighted equally
- 'distance' weight points by the inverse of their distance in this case closer neighbors of a query point will have a greater influence than neighbors which are further away

630sklearnneighbors Nearest Neighbors 2167

scikitlearn user guide Release 0213

- callable a userdefined function which accepts an array of distances and returns an array of the same shape containing the weights
 - algorithm 'auto' 'balltree' 'kdtree' 'brute' optional Algorithm used to compute the nearest neighbors
 - 'balltree' will use BallTree
 - 'kdtree' will use KDTree
 - 'brute' will use a brute force search
 - 'auto' will attempt to decide the most appropriate algorithm based on the values passed
- tofit method

Note fitting on sparse input will override the setting of this parameter using brute force

leafsize int optional default 30 Leaf size passed to BallTree or KDTree This can affect the speed of the construction and query as well as the memory required to store the tree The optimal value depends on the nature of the problem

p integer optional default 2 Power parameter for the Minkowski metric When p = 1 this is equivalent to using manhattan distance l1 and euclidean distance l2 for p = 2 For arbitrary p minkowski distance lp is used

metric string or callable default 'minkowski' the distance metric to use for the tree The default metric is minkowski and with p2 is equivalent to the standard Euclidean metric See the documentation of the DistanceMetric class for a list of available metrics

metricparams dict optional default None Additional keyword arguments for the metric function

njobs int or None optional default None The number of parallel jobs to run for neighbors search None means 1 unless in a joblibparallelbackend context 1 means using all processors See Glossary for more details Doesn't affect fit method

RadiusNeighborsRegressor

NearestNeighbors

Notes

See Nearest Neighbors in the online documentation for a discussion of the choice of algorithm and leafsize

Warning Regarding the Nearest Neighbors algorithms if it is found that two neighbors neighbor k1 and k have identical distances but different labels the results will depend on the ordering of the training data

https://en.wikipedia.org/wiki/Knearest_neighbor_algorithm

scikitlearn user guide Release 0213

Examples

```
X 0 1 2 3
y 0 0 1 1
from sklearn.neighbors import KNeighborsClassifier
neigh = KNeighborsClassifier(n_neighbors=3)
neigh.fit(X, y)
print(neigh.predict(1))
0
print(neigh.predict_proba(0))
[[0.66666667 0.33333333]]
```

Methods

```
fit(self, X, y) Fit the model using X as training data and y as target values
get_params(self, deep=True) Get parameters for this estimator
kneighbors(self, X, n_neighbors=5) Finds the Kneighbors of a point
kneighbors_graph(self, X, n_neighbors, mode='distance') Computes the weighted graph of kNeighbors for points in X
predict(self, X) Predict the class labels for the provided data
predict_proba(self, X) Return probability estimates for the test data X
score(self, X, y, sample_weight) Returns the mean accuracy on the given test data and labels
set_params(self, **params) Set the parameters of this estimator
init(self, n_neighbors=5, weights='uniform', algorithm='auto', leafsize=30, p=2, metric='minkowski', metric_params=None, n_jobs=None, **kwargs)
fit(self, X, y) Fit the model using X as training data and y as target values
```

Parameters

```
X arraylike sparse matrix BallTree KDTree Training data If array or matrix shape
n_samples n_features or n_samples n_samples if metric='precomputed'
y arraylike sparse matrix Target values of shape n_samples or n_samples
n_neighbors int, default=5
```

get_params(self, deep=True)

Get parameters for this estimator

Parameters

```
deep boolean optional If True will return the parameters for this estimator and contained subobjects that are estimators
```

Returns

```
params mapping of string to any Parameter names mapped to their values
```

kneighbors(self, X=None, n_neighbors=None, return_distance=True)

Finds the Kneighbors of a point Returns indices of and distances to the neighbors of each point

Parameters

```
X arraylike sparse matrix Target values of shape n_samples or n_samples
n_neighbors int, default=5
```

scikitlearn user guide Release 0213

Xarraylike shape nquery nfeatures or nquery nindexed if metric 'precomputed' The query point or points If not provided neighbors of each indexed point are returned In this case the query point is not considered its own neighbor
nneighbors int Number of neighbors to get default is the value passed to the constructor
returndistance boolean optional Defaults to True If False distances will not be returned

Returns
dist array Array representing the lengths to points only present if returndistanceTrue
ind array Indices of the nearest points in the population matrix

Examples
In the following example we construct a NeighborsClassifier class from an array representing our data set and ask who's the closest point to 111
samples 0 0 0 0 5 0 1 1 5
from sklearnneighbors import NearestNeighbors
neigh NearestNeighborsnneighbors1
neighfitsamples
NearestNeighborsalgorithmauto leafsize30
printneighkneighbors1 1 1
array05 array2

As you can see it returns 05 and 2 which means that the element is at distance 05 and is the third element of samples indexes start at 0 You can also query for multiple points
X 0 1 0 1 0 1
neighkneighborsX returndistance False
array1
2

kneighborsgraph selfXNone nneighborsNone mode'connectivity'
Computes the weighted graph of kNeighbors for points in X

Parameters
Xarraylike shape nquery nfeatures or nquery nindexed if metric 'precomputed' The query point or points If not provided neighbors of each indexed point are returned In this case the query point is not considered its own neighbor
nneighbors int Number of neighbors for each sample default is value passed to the constructor
mode 'connectivity' 'distance' optional Type of returned matrix 'connectivity' will return the connectivity matrix with ones and zeros in 'distance' the edges are Euclidean distance between points

Returns
Asparse matrix in CSR (Compressed Sparse Row) format shape nsamples nsamplesfit nsamplesfit is the number of samples in the fitted data A_{i j} is assigned the weight of edge that connects i to j

predictselfX

Predict the class labels for the provided data

Parameters

Xarraylike shape nquery nfeatures or nquery nindexed if metric 'precom

puted' Test samples

Returns

yarray of shape nsamples or nsamples noutputs Class labels for each data sample

predictproba selfX

Return probability estimates for the test data X

Parameters

Xarraylike shape nquery nfeatures or nquery nindexed if metric 'precom

puted' Test samples

Returns

parray of shape nsamples nclasses or a list of noutputs of such arrays if noutputs

1 The class probabilities of the input samples Classes are ordered by lexicographic

order

scoreselfXysampleweightNone

Returns the mean accuracy on the given test data and labels

In multilabel classification this is the subset accuracy which is a harsh metric since you require for each

sample that each label set be correctly predicted

Parameters

Xarraylike shape nsamples nfeatures Test samples

yarraylike shape nsamples or nsamples noutputs True labels for X

sampleweight arraylike shape nsamples optional Sample weights

Returns

score float Mean accuracy of selfpredictX wrt y

setparams selfparams

Set the parameters of this estimator

630sklearnneighbors Nearest Neighbors 2171

scikitlearn user guide Release 0213

The method works on simple estimators as well as on nested objects such as pipelines The latter have parameters of the form componentparameter so that it's possible to update each component of a nested object

Returns

self

Notes

See Nearest Neighbors in the online documentation for a discussion of the choice of algorithm and

leafsize

Warning Regarding the Nearest Neighbors algorithms if it is found that two neighbors neighbor k1 and
k have identical distances but different labels the results will depend on the ordering of the training data
https://en.wikipedia.org/wiki/Knearestneighbor_algorithm

Examples

```
X = [[0, 1, 2, 3],
      [0, 0, 1, 1]]
y = [0, 0, 1, 1]
from sklearn.neighbors import KNeighborsRegressor
neigh = KNeighborsRegressor(n_neighbors=2)
neigh.fit(X, y)
KNeighborsRegressor
print(neigh.predict([1.5,
0.5]))
630sklearn.neighbors.Nearest Neighbors 2173
```

Methods

fitself X y Fit the model using X as training data and y as target values

getparams self deep Get parameters for this estimator

kneighbors self X nneighbors Finds the Kneighbors of a point

kneighborsgraph self X nneighbors mode Computes the weighted graph of kNeighbors for points in X

predict self X Predict the target for the provided data

score self X y sampleweight Returns the coefficient of determination R2 of the prediction

setparams self params Set the parameters of this estimator

init selfnneighbors5 weights'uniform' algorithm'auto' leafsize30 p2metric'minkowski' metricparamsNone njobsNone kwargs

fitselfXy

Fit the model using X as training data and y as target values

Parameters

Xarraylike sparse matrix BallTree KDTree Training data If array or matrix shape nsamples nfeatures or nsamples nsamples if metric'precomputed'

yarraylike sparse matrix

Target values array of float values shape nsamples or nsamples noutputs

getparams selfdeepTrue

Get parameters for this estimator

Parameters

deep boolean optional If True will return the parameters for this estimator and contained subobjects that are estimators

Returns

params mapping of string to any Parameter names mapped to their values

kneighbors selfXNone nneighborsNone returndistanceTrue

Finds the Kneighbors of a point Returns indices of and distances to the neighbors of each point

Parameters

Xarraylike shape nquery nfeatures or nquery nindexed if metric 'precomputed' The query point or points If not provided neighbors of each indexed point are returned In this case the query point is not considered its own neighbor

nneighbors int Number of neighbors to get default is the value passed to the constructor

returndistance boolean optional Defaults to True If False distances will not be returned

Returns

dist array Array representing the lengths to points only present if returndistanceTrue

ind array Indices of the nearest points in the population matrix

Examples

In the following example we construct a NeighborsClassifier class from an array representing our data set and ask who's the closest point to 111

```
samples = 0 0 0 0 5 0 1 1 5
from sklearn.neighbors import NearestNeighbors
neigh = NearestNeighbors(nneighbors=1)
neigh.fit(samples)
NearestNeighbors(algorithm='auto', leafsize=30)
print(neigh.kneighbors(1, 1, 1))
array([0.5, array(2)])
```

As you can see it returns 0.5 and 2 which means that the element is at distance 0.5 and is the third element of samples indexes start at 0. You can also query for multiple points

```
X = 0 1 0 1 0 1
neigh.kneighbors(X, return_distance=False)
array([1, 2])
```

neigh.kneighbors_graph(self, X=None, n_neighbors=None, mode='connectivity')
Computes the weighted graph of kNeighbors for points in X

Parameters
X: array-like shape (n_query, n_features) or (n_query, n_indexed) if metric = 'precomputed'. The query point or points. If not provided neighbors of each indexed point are returned. In this case the query point is not considered its own neighbor.
n_neighbors: int. Number of neighbors for each sample. Default is value passed to the constructor.
mode: 'connectivity' or 'distance'. optional. Type of returned matrix. 'connectivity' will return the connectivity matrix with ones and zeros. In 'distance' the edges are Euclidean distance between points.

Returns
As sparse matrix in CSR (Compressed Sparse Row) format shape (n_samples, n_samples_fit). n_samples_fit is the number of samples in the fitted data. A[i, j] is assigned the weight of edge that connects i to j.

```

scikitlearn user guide Release 0.21.3

0.1.1

1.0.1

predictselfX

Predict the target for the provided data

Parameters

Xarraylike shape nquery nfeatures or nquery nindexed if metric 'precom

puted' Test samples

Returns

yarray of int shape nsamples or nsamples noutputs Target values

scoreselfXysampleweightNone

Returns the coefficient of determination R2 of the prediction

The coefficient R2 is defined as $1 - \frac{u}{v}$ where u is the residual sum of squares $y_{true} - y_{pred}$

2sum and v is the total sum of squares $y_{true} - y_{true\text{mean}}$ 2sum The best possible score

is 1.0 and it can be negative because the model can be arbitrarily worse A constant model that always

predicts the expected value of y disregarding the input features would get a R2 score of 0.0

Parameters

Xarraylike shape nsamples nfeatures Test samples For some estimators this may

be a precomputed kernel matrix instead shape nsamples nsamplesfitted where

nsamplesfitted is the number of samples used in the fitting for the estimator

yarraylike shape nsamples or nsamples noutputs True values for X

sampleweight arraylike shape nsamples optional Sample weights

Returns

score float R2 of selfpredictX wrt y

Notes

The R2 score used when calling score on a regressor will use multioutputuniformaverage

from version 0.23 to keep consistent with metricsr2score This will influence the score

method of all the multioutput regressors except for multioutputMultiOutputRegressor

To specify the default value manually and avoid the warning please either call metricsr2score

directly or make a custom scorer with metricsmakescorer the builtin scorer r2 uses

multioutputuniformaverage

setparams selfparams

Set the parameters of this estimator

The method works on simple estimators as well as on nested objects such as pipelines The latter have

parameters of the form componentparameter so that it's possible to update each component

of a nested object

Returns

self

Examples using sklearnneighborsKNeighborsRegressor

•Face completion with a multioutput estimators

6307sklearnneighbors LocalOutlierFactor

classsklearnneighbors LocalOutlierFactor nneighbors20 algorithm'auto'

leafsize30 metric'minkowski' p2met

ricparamsNone contamination'legacy'

noveltyFalse njobsNone

Unsupervised Outlier Detection using Local Outlier Factor LOF

The anomaly score of each sample is called Local Outlier Factor It measures the local deviation of density of a given sample with respect to its neighbors It is local in that the anomaly score depends on how isolated the object is with respect to the surrounding neighborhood More precisely locality is given by knearest neighbors whose distance is used to estimate the local density By comparing the local density of a sample to the local densities of its neighbors one can identify samples that have a substantially lower density than their neighbors These are considered outliers

Parameters

nneighbors int optional default20 Number of neighbors to use by default for kneighbors queries If nneighbors is larger than the number of samples provided all samples will be used

algorithm 'auto' 'balltree' 'kdtree' 'brute' optional Algorithm used to compute the nearest neighbors

- 'balltree' will use BallTree
- 'kdtree' will use KDTree
- 'brute' will use a brute force search
- 'auto' will attempt to decide the most appropriate algorithm based on the values passed to fit method

Note fitting on sparse input will override the setting of this parameter using brute force

leafsize int optional default30 Leaf size passed to BallTree or KDTree This can affect the speed of the construction and query as well as the memory required to store the tree The optimal value depends on the nature of the problem

metric string or callable default 'minkowski' metric used for the distance computation Any metric from scikitlearn or scipyspatialdistance can be used

If 'precomputed' the training input X is expected to be a distance matrix

If metric is a callable function it is called on each pair of instances rows and the resulting value recorded The callable should take two arrays as input and return one value indicating the distance between them This works for Scipy's metrics but is less efficient than passing the metric name as a string

Valid values for metric are

- from scikitlearn 'cityblock' 'cosine' 'euclidean' 'l1' 'l2' 'manhattan'
- from scipyspatialdistance 'braycurtis' 'canberra' 'chebyshev' 'correlation' 'dice' 'hamming' 'jaccard' 'kulsinski' 'mahalanobis' 'minkowski' 'rogerstanimoto' 'rus sellrao' 'seuclidean' 'sokalmichener' 'sokalsneath' 'sqeuclidean' 'yule'

630sklearnneighbors Nearest Neighbors 2177

scikitlearn user guide Release 0213

See the documentation for scipyspatialdistance for details on these metrics <https://docs.scipy.org/doc/scipy/reference/spatialdistance.html>

integer optional default 2 Parameter for the Minkowski metric from sklearn

metricspairwisepairwisedistances When $p = 1$ this is equivalent to

using manhattandistance l_1 and euclidean distance l_2 for $p = 2$ For arbitrary p

minkowskidistance l_p is used

metricparams dict optional default None Additional keyword arguments for the metric function

contamination float in [0, 0.5] optional default 0.1 The amount of contamination of the data set i.e. the proportion of outliers in the data set When fitting this is used to define the threshold on the decision function If “auto” the decision function threshold is determined as in the original paper

Changed in version 0.20 The default value of contamination will change from 0.1 in 0.20 to auto in 0.22

novelty boolean default False By default LocalOutlierFactor is only meant to be used for outlier detection novelty=False Set novelty to True if you want to use LocalOutlierFactor for novelty detection In this case be aware that that you should only use predict decisionfunction and scoresamples on new unseen data and not on the training set

njobs int or None optional default None The number of parallel jobs to run for neighbors search None means 1 unless in a joblibparallelbackend context1

means using all processors See Glossary for more details Affects only kneighbors and kneighborsgraph methods

Attributes

negativeoutlierfactor numpy array shape (n_samples) The opposite LOF of the training samples The higher the more normal Inliers tend to have a LOF score close to 1 negativeoutlierfactor close to 1 while outliers tend to have a larger LOF score

The local outlier factor LOF of a sample captures its supposed ‘degree of abnormality’ It is the average of the ratio of the local reachability density of a sample and those of its knearest neighbors

nneighbors integer The actual number of neighbors used for kneighbors queries offset float Offset used to obtain binary labels from the raw scores Observations having a negativeoutlierfactor smaller than offset are detected as abnormal The offset is set to 15 inliers score around 1 except when a contamination parameter different than “auto” is provided In that case the offset is defined in such a way we obtain the expected number of outliers in training

```

predict

Predict the labels 1 inlier 1 outlier of X according to LOF

This method allows to generalize prediction to new observations not in the training set Only available for novelty detection when novelty is set to True

Parameters

X array-like shape (nsamples, nfeatures) The query sample or samples to compute the Local Outlier Factor wrt to the training samples

Returns

is_inlier array shape (nsamples) Returns 1 for anomalies outliers and 1 for inliers

scores array shape (nsamples)

Opposite of the Local Outlier Factor of X

It is the opposite as bigger is better ie large values correspond to inliers

Only available for novelty detection when novelty is set to True The argument X is supposed to contain new data if X contains a point from training it considers the later in its own neighborhood Also the samples in X are not considered in the neighborhood of any point The scores array on training data is available by considering the the negative_outlier_factor_ attribute

Parameters

X array-like shape (nsamples, nfeatures) The query sample or samples to compute the Local Outlier Factor wrt the training samples

Returns

opposite_lof_scores array shape (nsamples) The opposite of the Local Outlier Factor of each input samples The lower the more abnormal

radiusneighborsgraph self X radius

modeComputes the weighted graph of Neighbors for points in X

score self X y sampleweight Returns the mean accuracy on the given test data and labels

setparams self params Set the parameters of this estimator

init selfradius10 weights'uniform' algorithm'auto' leafsize30 p2met

ric'minkowski' outlierlabelNone metricparamsNone njobsNone kwargs

fitselfXy

Fit the model using X as training data and y as target values

Parameters

Xarraylike sparse matrix BallTree KDTree Training data If array or matrix shape

nsamples nfeatures or nsamples nsamples if metric'precomputed'

yarraylike sparse matrix Target values of shape nsamples or nsamples

noutputs

getparams selfdeepTrue

Get parameters for this estimator

Parameters

deep boolean optional If True will return the parameters for this estimator and contained

subobjects that are estimators

Returns

params mapping of string to any Parameter names mapped to their values

predictselfX

Predict the class labels for the provided data

Parameters

Xarraylike shape nquery nfeatures or nquery nindexed if metric 'precom

puted' Test samples

Returns

yarray of shape nsamples or nsamples noutputs Class labels for each data sample

radiusneighbors selfXNone radiusNone returndistanceTrue

Finds the neighbors within a given radius of a point or points

Return the indices and distances of each point from the dataset lying in a ball with size radius around

the points of the query array Points lying on the boundary are included in the results

The result points are notnecessarily sorted by distance to their query point

Parameters

2184 Chapter 6 API (Application Programming Interface) Reference

scikitlearn user guide Release 0213

Xarraylike nsamples nfeatures optional The query point or points If not provided neighbors of each indexed point are returned In this case the query point is not considered its own neighbor

radius float Limiting distance of neighbors to return default is the value passed to the constructor

returndistance boolean optional Defaults to True If False distances will not be re turned

Returns

dist array shape nsamples of arrays Array representing the distances to each point only present if returndistanceTrue The distance values are computed according to the metric constructor parameter

ind array shape nsamples of arrays An array of arrays of indices of the approximate nearest points from the population matrix that lie within a ball of size radius around the query points

Notes

Because the number of neighbors of each point is not necessarily equal the results for multiple query points cannot be fit in a standard data array For efficiency radiusneighbors returns arrays of objects where each object is a 1D array of indices or distances

Examples

In the following example we construct a NeighborsClassifier class from an array representing our data set and ask who's the closest point to 1 1 1

```
import numpy as np
samples = 0 0 0 0 5 0 1 1 5
from sklearn.neighbors import NearestNeighbors
neigh = NearestNeighbors(radius=16)
neigh.fit(samples)
NearestNeighbors(radius=16, algorithm='auto', leafsize=30)
rng = np.random.RandomState(1)
print(np.asarray(rng, dtype='float64').shape)
print(np.asarray(rng, dtype='float64').shape)
1 2
```

The first array returned contains the distances to all points which are closer than 16 while the second array returned contains their indices In general multiple points can be queried at the same time

radiusneighborsgraph selfXNone radiusNone mode'connectivity'

Computes the weighted graph of Neighbors for points in X

Neighborhoods are restricted the points at a distance lower than radius

Parameters

Xarraylike shape nsamples nfeatures optional The query point or points If not provided neighbors of each indexed point are returned In this case the query point is not considered its own neighbor

radius float Radius of neighborhoods default is the value passed to the constructor

630sklearn.neighbors Nearest Neighbors 2185

scikitlearn user guide Release 0213

mode 'connectivity' 'distance' optional Type of returned matrix 'connectivity' will return the connectivity matrix with ones and zeros in 'distance' the edges are Euclidean distance between points

Returns

fit(self, X, y) Fit the model using X as training data and y as target values

Parameters

X array-like sparse matrix, BallTree, KDTree Training data. If array or matrix shape (n_samples, n_features) or (n_samples, n_samples) if metric='precomputed'

y array-like sparse matrix Target values array of float values shape (n_samples) or (n_samples, n_outputs)

2188 Chapter 6 API (Application Programming Interface) Reference

scikitlearn user guide Release 0213

getparams selfdeepTrue

Get parameters for this estimator

Parameters

deep boolean optional If True will return the parameters for this estimator and contained subobjects that are estimators

Returns

params mapping of string to any Parameter names mapped to their values

predictselfX

Predict the target for the provided data

Parameters

Xarraylike shape nquery nfeatures or nquery nindexed if metric 'precomputed' Test samples

Returns

yarray of float shape nsamples or nsamples noutputs Target values

radiusneighbors selfXNone radiusNone returndistanceTrue

Finds the neighbors within a given radius of a point or points

Return the indices and distances of each point from the dataset lying in a ball with size radius around the points of the query array Points lying on the boundary are included in the results

The result points are notnecessarily sorted by distance to their query point

Parameters

Xarraylike nsamples nfeatures optional The query point or points If not provided

neighbors of each indexed point are returned In this case the query point is not considered its own neighbor

radius float Limiting distance of neighbors to return default is the value passed to the constructor

returndistance boolean optional Defaults to True If False distances will not be returned

Returns

dist array shape nsamples of arrays Array representing the distances to each point

only present if returndistanceTrue The distance values are computed according to the metric constructor parameter

ind array shape nsamples of arrays An array of arrays of indices of the approximate nearest points from the population matrix that lie within a ball of size radius around the query points

Notes

Because the number of neighbors of each point is not necessarily equal the results for multiple query points cannot be fit in a standard data array For efficiency radiusneighbors returns arrays of objects where each object is a 1D array of indices or distances

630sklearnneighbors Nearest Neighbors 2189

Examples

In the following example we construct a NeighborsClassifier class from an array representing our data set and ask who's the closest point to 1 1 1

```
import numpy as np
samples = 0 0 0 0 5 0 1 1 5
from sklearn.neighbors import NearestNeighbors
neigh = NearestNeighbors(radius=16)
neigh.fit(samples)
NearestNeighbors(algorithm='auto', leafsize=30)
rng = neigh.radius_neighbors(1, 1, 1)
print(np.asarray(rng, dtype=object))
[[15, 05],
 [1, 2]]
```

The first array returned contains the distances to all points which are closer than 16 while the second array returned contains their indices. In general, multiple points can be queried at the same time.

radius_neighbors_graph(self, X=None, radius=None, mode='connectivity')

Computes the weighted graph of Neighbors for points in X.

Neighborhoods are restricted to the points at a distance lower than radius.

Parameters

X: array-like shape (n_samples, n_features) optional. The query point or points. If not provided, neighbors of each indexed point are returned. In this case, the query point is not considered its own neighbor.

radius: float. Radius of neighborhoods. Default is the value passed to the constructor.

mode: 'connectivity' or 'distance' optional. Type of returned matrix. 'connectivity' will

return the connectivity matrix with ones and zeros. In 'distance' the edges are Euclidean

distance between points.

Returns

A sparse matrix in CSR (Compressed Sparse Row) format shape (n_samples, n_samples). A_{i,j} is assigned the weight of edge that connects i to j.

kneighbors_graph

Examples

```
X = 0 3 1
from sklearn.neighbors import NearestNeighbors
neigh = NearestNeighbors(radius=15)
neigh.fit(X)
NearestNeighbors(algorithm='auto', leafsize=30)
A = neigh.radius_neighbors_graph(X)
A.toarray()
array([[1, 0, 1],
       [0, 1, 0],
       [1, 0, 1]])
```

scikitlearn user guide Release 0213

scoreselfXysampleweightNone

Returns the coefficient of determination R2 of the prediction

The coefficient R2 is defined as $1 - \frac{u}{v}$ where u is the residual sum of squares $y_{true} - y_{pred}$

2sum and v is the total sum of squares $y_{true} - y_{truemean}$ 2sum The best possible score

is 10 and it can be negative because the model can be arbitrarily worse A constant model that always

predicts the expected value of y disregarding the input features would get a R2 score of 00

Parameters

Xarraylike shape nsamples nfeatures Test samples For some estimators this may

be a precomputed kernel matrix instead shape nsamples nsamplesfitted where

nsamplesfitted is the number of samples used in the fitting for the estimator

yarraylike shape nsamples or nsamples noutputs True values for X

sampleweight arraylike shape nsamples optional Sample weights

Returns

score float R2 of selfpredictX wrt y

Notes

The R2 score used when calling score on a regressor will use multioutputuniformaverage

from version 023 to keep consistent with metricsr2score This will influence the score

method of all the multioutput regressors except for multioutputMultiOutputRegressor

To specify the default value manually and avoid the warning please either call metricsr2score

directly or make a custom scorer with metricsmakescorer the builtin scorer r2 uses

multioutputuniformaverage

setparams selfparams

Set the parameters of this estimator

The method works on simple estimators as well as on nested objects such as pipelines The latter have

parameters of the form componentparameter so that it's possible to update each component

of a nested object

Returns

self

63010sklearnneighbors NearestCentroid

classsklearnneighbors NearestCentroid metric'euclidean' shrinkthresholdNone

Nearest centroid classifier

Each class is represented by its centroid with test samples classified to the class with the nearest centroid

Read more in the User Guide

Parameters

metric string or callable The metric to use when calculating distance between instances in

a feature array If metric is a string or callable it must be one of the options allowed by

metricspairwisepairwisedistances for its metric parameter The centroids for the samples

corresponding to each class is the point from which the sum of the distances according to

the metric of all samples that belong to that particular class are minimized If the "manhat

tan" metric is provided this centroid is the median and for all other metrics the centroid is

now set to be the mean

630sklearnneighbors Nearest Neighbors 2191

scikitlearn user guide Release 0213

shrinkthreshold float optional default None Threshold for shrinking centroids to re
move features

Attributes

centroids arraylike shape nclasses nfeatures Centroid of each class

scikitlearn user guide Release 0213

centroid shrinking cannot be used with sparse matrices

yarray shape nsamples Target values integers

getparams selfdeepTrue

Get parameters for this estimator

Parameters

deep boolean optional If True will return the parameters for this estimator and contained

subobjects that are estimators

Returns

params mapping of string to any Parameter names mapped to their values

predictselfX

Perform classification on an array of test vectors X

The predicted class C for each sample in X is returned

Parameters

Xarraylike shape nsamples nfeatures

Returns

Carray shape nsamples

Notes

If the metric constructor parameter is “precomputed” X is assumed to be the distance matrix between the

data to be predicted and selfcentroids

scoreselfXysampleweightNone

Returns the mean accuracy on the given test data and labels

In multilabel classification this is the subset accuracy which is a harsh metric since you require for each

sample that each label set be correctly predicted

Parameters

Xarraylike shape nsamples nfeatures Test samples

yarraylike shape nsamples or nsamples noutputs True labels for X

sampleweight arraylike shape nsamples optional Sample weights

Returns

score float Mean accuracy of selfpredictX wrt y

setparams selfparams

Set the parameters of this estimator

The method works on simple estimators as well as on nested objects such as pipelines The latter have

parameters of the form componentparameter so that it’s possible to update each component

of a nested object

Returns

self

630sklearnneighbors Nearest Neighbors 2193

scikitlearn user guide Release 0213

Examples using sklearnneighborsNearestCentroid

- Nearest Centroid Classification
- Classification of text documents using sparse features

63011sklearnneighbors NearestNeighbors

classsklearnneighbors NearestNeighbors nneighbors5 radius10 algorithm'auto'

leafsize30 metric'minkowski' p2met

ricparamsNone njobsNone kwargs

Unsupervised learner for implementing neighbor searches

Read more in the User Guide

Parameters

nneighbors int optional default 5 Number of neighbors to use by default for
kneighbors queries

radius float optional default 10 Range of parameter space to use by default for

radiusneighbors queries

algorithm 'auto' 'balltree' 'kdtree' 'brute' optional Algorithm used to compute the
nearest neighbors

- 'balltree' will use BallTree
- 'kdtree' will use KDTree
- 'brute' will use a brute force search
- 'auto' will attempt to decide the most appropriate algorithm based on the values passed

tofit method

Note fitting on sparse input will override the setting of this parameter using brute force

leafsize int optional default 30 Leaf size passed to BallTree or KDTree This can affect
the speed of the construction and query as well as the memory required to store the tree

The optimal value depends on the nature of the problem

metric string or callable default 'minkowski' metric to use for distance computation Any

metric from scikitlearn or scipyspatialdistance can be used

If metric is a callable function it is called on each pair of instances rows and the resulting
value recorded The callable should take two arrays as input and return one value indicating
the distance between them This works for Scipy's metrics but is less efficient than passing
the metric name as a string

Distance matrices are not supported

Valid values for metric are

- from scikitlearn 'cityblock' 'cosine' 'euclidean' 'l1' 'l2' 'manhattan'
- from scipyspatialdistance 'braycurtis' 'canberra' 'chebyshev' 'correlation' 'dice'
- 'hamming' 'jaccard' 'kulsinski' 'mahalanobis' 'minkowski' 'rogerstanimoto' 'rus
- sellrao' 'seuclidean' 'sokalmichener' 'sokalsneath' 'sqeuclidean' 'yule'

See the documentation for scipyspatialdistance for details on these metrics

2194 Chapter 6 API (Application Programming Interface) Reference

scikitlearn user guide Release 0.21.3

`p`: integer optional default 2 Parameter for the Minkowski metric from `sklearn.metrics.pairwise_distances`. When `p = 1` this is equivalent to using `manhattan_distance` `l1` and `euclidean_distance` `l2` for `p = 2`. For arbitrary `p` `minkowski_distance` `lp` is used.

`metric_params`: dict optional default None Additional keyword arguments for the metric function.

`n_jobs`: int or None optional default None The number of parallel jobs to run for neighbors.

`search`: None means 1 unless in a `joblib.parallel_backend` context. 1 means using all processors. See Glossary for more details.

class sklearn.neighbors.NeighborhoodComponentsAnalysis(n_components=None)

init('auto', warm_start=False)

max_iter=50 tol=1e-05

callback=None verbose=0

random_state=None

Neighborhood Components Analysis

Neighborhood Component Analysis (NCA) is a machine learning algorithm for metric learning It learns a linear transformation in a supervised fashion to improve the classification accuracy of a stochastic nearest neighbors rule in the transformed space

Read more in the User Guide

630sklearn.neighbors.Nearest Neighbors 2199

Parameters

ncomponents int optional defaultNone Preferred dimensionality of the projected space
If None it will be set to nfeatures
init string or numpy array optional default'auto' Initialization of the linear transformation
Possible options are 'auto' 'pca' 'lda' 'identity' 'random' and a numpy array of shape
nfeaturesa nfeaturesb
'auto' Depending on ncomponents the most reasonable initialization will be chosen
If ncomponents nclasses we use 'lda' as it uses labels information If
not but ncomponents minnfeatures nsamples we use 'pca' as it
projects data in meaningful directions those of higher variance Otherwise we just use
'identity'
'pca' ncomponents principal components of the inputs passed to fit will be used to
initialize the transformation See decompositionPCA
'lda' minncomponents nclasses most discriminative components of the
inputs passed to fit will be used to initialize the transformation If
ncomponents nclasses the rest of the components will be zero See
discriminantanalysisLinearDiscriminantAnalysis
'identity' If ncomponents is strictly smaller than the dimensionality of the inputs
passed to fit the identity matrix will be truncated to the first ncomponents rows
'random' The initial transformation will be a random array of shape ncomponents
nfeatures Each value is sampled from the standard normal distribution
numpy array nfeaturesb must match the dimensionality of the inputs passed to fit
and nfeaturesa must be less than or equal to that If ncomponents is not None
nfeaturesa must match it
warmstart bool optional defaultFalse If True and fit has been called before the solu
tion of the previous call to fit is used as the initial linear transformation ncomponents
and init will be ignored
maxiter int optional default50 Maximum number of iterations in the optimization
tol float optional default1e5 Convergence tolerance for the optimization
callback callable optional defaultNone If not None this function is called after every
iteration of the optimizer taking as arguments the current solution flattened transformation
matrix and the number of iterations This might be useful in case one wants to examine or
store the transformation found after each iteration
verbose int optional default0 If 0 no progress messages will be printed If 1 progress
messages will be printed to stdout If 2 progress messages will be printed and the disp
parameter of scipy.optimize.minimize will be set to verbose 2
randomstate int or numpyRandomState or None optional defaultNone A pseudo ran
dom number generator object or a seed for it if int If initpca randomstate
is used to initialize the random transformation If initpca randomstate is
passed as an argument to PCA (Principal Component Analysis) when initializing the transformation
Attributes
components array shape ncomponents nfeatures The linear transformation learned dur
ing fitting
niter int Counts the number of iterations performed by the optimizer

class sklearnneuralnetwork BernoulliRBM ncomponents=256 learningrate=0.1

batchsize=10 niter=10 verbose=0 random_state=None

domstate=None

Bernoulli Restricted Boltzmann Machine RBM

A Restricted Boltzmann Machine with binary visible units and binary hidden units. Parameters are estimated using Stochastic Maximum Likelihood (SML) also known as Persistent Contrastive Divergence (PCD).

The time complexity of this implementation is $O(d^2n)$ assuming $d \gg n$ features, n components.

Read more in the User Guide

Parameters

ncomponents int optional Number of binary hidden units

learningrate float optional The learning rate for weight updates. It is highly recommended to tune this hyperparameter. Reasonable values are in the $[10^{-3}, 10^{-1}]$ range.

batchsize int optional Number of examples per minibatch

niter int optional Number of iterations (sweeps) over the training dataset to perform during training

verbose int optional The verbosity level. The default zero means silent mode.

randomstate integer or RandomState optional A random number generator instance to define the state of the random permutations generator. If an integer is given it fixes the seed.

Defaults to the global numpy random number generator.

Attributes

Examples

```
import numpy as np
from sklearn.neural_network import BernoulliRBM
```

```
X = np.array([0 0 0 1 1 1 0 1 1 1 1 1])
```

```
model = BernoulliRBM(n_components=2)
```

```
model.fit(X)
```

```
BernoulliRBM(batch_size=10, learning_rate=0.1, n_components=2, n_iter=10,
```

```
random_state=None, verbose=0)
```

Methods

```
fit(self, X, y) Fit the model to the data X
```

```
fit_transform(self, X, y) Fit to data then transform it
```

```
get_params(self, deep=True) Get parameters for this estimator
```

```
gibbs(self, v) Perform one Gibbs sampling step
```

```
partial_fit(self, X, y) Fit the model to the data X which should contain a par
```

```
tial segment of the data
```

```
score_samples(self, X) Compute the pseudolikelihood of X
```

```
set_params(self, **kwargs) Set the parameters of this estimator
```

```
transform(self, X) Compute the hidden layer activation probabilities
```

```
Ph1vX
```

```
init(self, n_components=256, learning_rate=0.1, batch_size=10, n_iter=10, verbose=0, ran
```

```
dom_state=None)
```

```
fit(self, X, y=None)
```

```
Fit the model to the data X
```

Parameters

X arraylike sparse matrix shape nsamples nfeatures Training data

Returns

self BernoulliRBM The fitted model

```
fit_transform(self, X, y=None) fit_params
```

```
Fit to data then transform it
```

2206 Chapter 6 API (Application Programming Interface) Reference

scikitlearn user guide Release 0213

Fits transformer to X and y with optional parameters fitparams and returns a transformed version of X
Parameters

Xnumpy array of shape nsamples nfeatures Training set

ynumpy array of shape nsamples Target values

Returns

Xnew numpy array of shape nsamples nfeaturesnew Transformed array

getparams selfdeepTrue

Get parameters for this estimator

Parameters

deep boolean optional If True will return the parameters for this estimator and contained

subobjects that are estimators

Returns

params mapping of string to any Parameter names mapped to their values

gibbssselfv

Perform one Gibbs sampling step

Parameters

varraylike shape nsamples nfeatures Values of the visible layer to start from

Returns

vnew arraylike shape nsamples nfeatures Values of the visible layer after one Gibbs

step

partialfit selfXyNone

Fit the model to the data X which should contain a partial segment of the data

Parameters

Xarraylike shape nsamples nfeatures Training data

Returns

self BernoulliRBM The fitted model

scoresamples selfX

Compute the pseudolikelihood of X

Parameters

Xarraylike sparse matrix shape nsamples nfeatures Values of the visible layer

Must be allboolean not checked

Returns

pseudolikelihood arraylike shape nsamples Value of the pseudolikelihood proxy

for likelihood

Notes

This method is not deterministic it computes a quantity called the free energy on X then on a randomly corrupted version of X and returns the log of the logistic function of the difference

631sklearnneuralnetwork Neural network models 2207

scikitlearn user guide Release 0213

setparams selfparams

Set the parameters of this estimator

The method works on simple estimators as well as on nested objects such as pipelines The latter have parameters of the form componentparameter so that it's possible to update each component of a nested object

Returns

self

transform selfX

Compute the hidden layer activation probabilities $Ph1vX$

Parameters

Xarraylike sparse matrix shape nsamples nfeatures The data to be transformed

Returns

harray shape nsamples ncomponents Latent representations of the data

Examples using sklearnneuralnetworkBernoulliRBM

Multilayer Perceptron classifier

This model optimizes the logloss function using LBFGS or stochastic gradient descent

New in version 018

Parameters

hiddenlayersizes tuple length nlayers 2 default 100 The ith element represents the

number of neurons in the ith hidden layer

activation 'identity' 'logistic' 'tanh' 'relu' default 'relu' Activation function for the hid

den layer

- 'identity' noop activation useful to implement linear bottleneck returns $fx \cdot x$
- 'logistic' the logistic sigmoid function returns $fx \cdot \frac{1}{1 + \exp x}$
- 'tanh' the hyperbolic tan function returns $fx \cdot \tanh x$
- 'relu' the rectified linear unit function returns $fx \cdot \max(0, x)$

solver 'lbfgs' 'sgd' 'adam' default 'adam' The solver for weight optimization

2208 Chapter 6 API (Application Programming Interface) Reference

scikitlearn user guide Release 0213

- ‘lbfgs’ is an optimizer in the family of quasiNewton methods
- ‘sgd’ refers to stochastic gradient descent
- ‘adam’ refers to a stochastic gradientbased optimizer proposed by Kingma Diederik and Jimmy Ba

Note The default solver ‘adam’ works pretty well on relatively large datasets with thousands of training samples or more in terms of both training time and validation score For small datasets however ‘lbfgs’ can converge faster and perform better

alpha float optional default 0.0001 L2 penalty regularization term parameter

batchsize int optional default ‘auto’ Size of minibatches for stochastic optimizers If the solver is ‘lbfgs’ the classifier will not use minibatch When set to “auto”

batchsizemin200 nsamples

learningrate ‘constant’ ‘invscaling’ ‘adaptive’ default ‘constant’ Learning rate schedule for weight updates

- ‘constant’ is a constant learning rate given by ‘learningrateinit’
- ‘invscaling’ gradually decreases the learning rate at each time step ‘t’ using an inverse scaling exponent of ‘power’ effectivelearningrate learningrateinit powt

power

- ‘adaptive’ keeps the learning rate constant to ‘learningrateinit’ as long as training loss keeps decreasing Each time two consecutive epochs fail to decrease training loss by at least tol or fail to increase validation score by at least tol if ‘earlystopping’ is on the current learning rate is divided by 5

Only used when solversgd

learningrateinit double optional default 0.001 The initial learning rate used It controls the stepsize in updating the weights Only used when solver’sgd’ or ‘adam’

power double optional default 0.5 The exponent for inverse scaling learning rate It is used in updating effective learning rate when the learningrate is set to ‘invscaling’ Only used when solver’sgd’

maxiter int optional default 200 Maximum number of iterations The solver iterates until convergence determined by ‘tol’ or this number of iterations For stochastic solvers ‘sgd’ ‘adam’ note that this determines the number of epochs how many times each data point will be used not the number of gradient steps

shuffle bool optional default True Whether to shuffle samples in each iteration Only used when solver’sgd’ or ‘adam’

randomstate int RandomState instance or None optional default None If int randomstate is the seed used by the random number generator If RandomState instance randomstate is the random number generator If None the random number generator is the RandomState instance used by nprandom

tolfloat optional default 1e-4 Tolerance for the optimization When the loss or score is not improving by at least tol for niternochange consecutive iterations unless

learningrate is set to ‘adaptive’ convergence is considered to be reached and training stops

verbose bool optional default False Whether to print progress messages to stdout

warmstart bool optional default False When set to True reuse the solution of the previous call to fit as initialization otherwise just erase the previous solution See the Glossary

631sklearnneuralnetwork Neural network models 2209

scikitlearn user guide Release 0213

momentum float default 0.9 Momentum for gradient descent update Should be between 0 and 1 Only used when solver='sgd'

nesterovsmomentum boolean default True Whether to use Nesterov's momentum Only used when solver='sgd' and momentum = 0

earlystopping bool default False Whether to use early stopping to terminate training when validation score is not improving If set to true it will automatically set aside 10% of training data as validation and terminate training when validation score is not improving by at least tol for niter_nocchange consecutive epochs The split is stratified except in a multilabel setting Only effective when solver='sgd' or 'adam'

validationfraction float optional default 0.1 The proportion of training data to set aside as validation set for early stopping Must be between 0 and 1 Only used if earlystopping is True

beta1 float optional default 0.9 Exponential decay rate for estimates of first moment vector in adam should be in [0, 1] Only used when solver='adam'

beta2 float optional default 0.999 Exponential decay rate for estimates of second moment vector in adam should be in [0, 1] Only used when solver='adam'

epsilon float optional default 1e-8 Value for numerical stability in adam Only used when solver='adam'

niter_nocchange int optional default 10 Maximum number of epochs to not meet tol improvement Only effective when solver='sgd' or 'adam'

New in version 0.20

Attributes

classes array or list of array of shape n_classes Class labels for each output

loss float The current loss computed with the loss function

coefs list length n_layers - 1 The i-th element in the list represents the weight matrix corresponding to layer i

intercepts list length n_layers - 1 The i-th element in the list represents the bias vector corresponding to layer i - 1

niter int The number of iterations the solver has ran

n_layers int Number of layers

n_outputs int Number of outputs

out_activation string Name of the output activation function

Notes

MLPClassifier trains iteratively since at each time step the partial derivatives of the loss function with respect to the model parameters are computed to update the parameters

It can also have a regularization term added to the loss function that shrinks model parameters to prevent over fitting

This implementation works with data represented as dense numpy arrays or sparse scipy arrays of floating point values

fitselfXy

Fit the model to data matrix X and targets y

Parameters

Xarraylike or sparse matrix shape nsamples nfeatures The input data
yarraylike shape nsamples or nsamples noutputs The target values class labels in classification real numbers in regression
Returns

self returns a trained MLP model
getparams selfdeepTrue
Get parameters for this estimator

Parameters

deep boolean optional If True will return the parameters for this estimator and contained subobjects that are estimators
Returns
params mapping of string to any Parameter names mapped to their values

partialfit

Update the model with a single iteration over the given data

scikitlearn user guide Release 0213

Parameters

Xarraylike sparse matrix shape nsamples nfeatures The input data

yarraylike shape nsamples The target values

classes array shape nclasses default None Classes across all calls to partialfit Can be obtained via npuniqueyall where yall is the target vector of the entire dataset

This argument is required for the first call to partialfit and can be omitted in the subsequent calls Note that y doesn't need to contain all labels in classes

Returns

self returns a trained MLP model

predictselfX

Predict using the multilayer perceptron classifier

Parameters

Xarraylike sparse matrix shape nsamples nfeatures The input data

Returns

yarraylike shape nsamples or nsamples nclasses The predicted classes

predictlogproba selfX

Return the log of probability estimates

Parameters

Xarraylike shape nsamples nfeatures The input data

Returns

logyprob arraylike shape nsamples nclasses The predicted logprobability of the sample for each class in the model where classes are ordered as they are in selfclasses Equivalent to logpredictprobaX

predictproba selfX

Probability estimates

Parameters

Xarraylike sparse matrix shape nsamples nfeatures The input data

Returns

yprob arraylike shape nsamples nclasses The predicted probability of the sample for each class in the model where classes are ordered as they are in selfclasses

scoreselfXysampleweightNone

Returns the mean accuracy on the given test data and labels

In multilabel classification this is the subset accuracy which is a harsh metric since you require for each sample that each label set be correctly predicted

Parameters

Xarraylike shape nsamples nfeatures Test samples

yarraylike shape nsamples or nsamples noutputs True labels for X

sampleweight arraylike shape nsamples optional Sample weights

Returns

score float Mean accuracy of selfpredictX wrt y

2212 Chapter 6 API (Application Programming Interface) Reference

scikitlearn user guide Release 0.21.3

set_params(self, **kwargs)

Set the parameters of this estimator

The method works on simple estimators as well as on nested objects such as pipelines. The latter have parameters of the form `component__parameter` so that it's possible to update each component of a nested object.

Returns

self

Examples using `sklearn.neural_network.MLPClassifier`

- Classifier comparison
- Visualization of MLP weights on MNIST
- Varying regularization in Multilayer Perceptron
- Compare Stochastic learning strategies for `MLPClassifier`

6313 `sklearn.neural_network.MLPRegressor`

`class sklearn.neural_network.MLPRegressor(hidden_layer_sizes=100, activation='relu', solver='adam', alpha=0.0001,`

`beta_1=0.9, beta_2=0.999, epsilon=1e-08,`

`n_iter_no_change=10`

Multilayer Perceptron regressor

This model optimizes the squared loss using LBFGS or stochastic gradient descent

New in version 0.18

Parameters

`hidden_layer_sizes`: tuple length `n_layers - 2`, default 100. The *i*th element represents the number of neurons in the *i*th hidden layer.

`activation`: 'identity', 'logistic', 'tanh', 'relu', default 'relu'. Activation function for the hidden layer.

• 'identity': no-op activation, useful to implement linear bottleneck, returns $f(x) = x$

• 'logistic': the logistic sigmoid function, returns $f(x) = \frac{1}{1 + \exp(-x)}$

• 'tanh': the hyperbolic tan function, returns $f(x) = \tanh(x)$

• 'relu': the rectified linear unit function, returns $f(x) = \max(0, x)$

`solver`: 'lbfgs', 'sgd', 'adam', default 'adam'. The solver for weight optimization.

• 'lbfgs' is an optimizer in the family of quasi-Newton methods.

• 'sgd' refers to stochastic gradient descent.

6313 `sklearn.neural_network` Neural network models 22/13

scikitlearn user guide Release 0213

- ‘adam’ refers to a stochastic gradientbased optimizer proposed by Kingma Diederik and Jimmy Ba

Note The default solver ‘adam’ works pretty well on relatively large datasets with thou sands of training samples or more in terms of both training time and validation score For small datasets however ‘lbfgs’ can converge faster and perform better

alpha float optional default 00001 L2 penalty regularization term parameter
batchsize int optional default ‘auto’ Size of minibatches for stochastic optimizers If the solver is ‘lbfgs’ the classifier will not use minibatch When set to “auto”

batchsizemin200 nsamples

learningrate ‘constant’ ‘invscaling’ ‘adaptive’ default ‘constant’ Learning rate schedule for weight updates

- ‘constant’ is a constant learning rate given by ‘learningrateinit’
- ‘invscaling’ gradually decreases the learning rate learningrate at each time step ‘t’ using an inverse scaling exponent of ‘powert’ effectivelearningrate learn ingrateinit powt powert

• ‘adaptive’ keeps the learning rate constant to ‘learningrateinit’ as long as training loss keeps decreasing Each time two consecutive epochs fail to decrease training loss by at least tol or fail to increase validation score by at least tol if ‘earlystopping’ is on the current learning rate is divided by 5

Only used when solver’sgd’

learningrateinit double optional default 0001 The initial learning rate used It controls

the stepsize in updating the weights Only used when solver’sgd’ or ‘adam’

powert double optional default 05 The exponent for inverse scaling learning rate It is used in updating effective learning rate when the learningrate is set to ‘invscaling’ Only used when solver’sgd’

maxiter int optional default 200 Maximum number of iterations The solver iterates until convergence determined by ‘tol’ or this number of iterations For stochastic solvers ‘sgd’ ‘adam’ note that this determines the number of epochs how many times each data point will be used not the number of gradient steps

shuffle bool optional default True Whether to shuffle samples in each iteration Only used when solver’sgd’ or ‘adam’

randomstate int RandomState instance or None optional default None If int randomstate is the seed used by the random number generator If RandomState instance randomstate is the random number generator If None the random number generator is the RandomState instance used by nprandom

tolfloat optional default 1e4 Tolerance for the optimization When the loss or score is not improving by at least tol forniternochange consecutive iterations unless learningrate is set to ‘adaptive’ convergence is considered to be reached and training stops

verbose bool optional default False Whether to print progress messages to stdout

warmstart bool optional default False When set to True reuse the solution of the previous call to fit as initialization otherwise just erase the previous solution See the Glossary

scikitlearn user guide Release 0213

predictselfX

Predict using the multilayer perceptron model

Parameters

Xarraylike sparse matrix shape nsamples nfeatures The input data

Returns

yarraylike shape nsamples noutputs The predicted values

scoreselfXysampleweightNone

Returns the coefficient of determination R2 of the prediction

The coefficient R2 is defined as $1 - \frac{u}{v}$ where u is the residual sum of squares $y_{true} - y_{pred}$

2sum and v is the total sum of squares $y_{true} - y_{truemean}$ 2sum The best possible score

is 10 and it can be negative because the model can be arbitrarily worse A constant model that always

predicts the expected value of y disregarding the input features would get a R2 score of 00

Parameters

Xarraylike shape nsamples nfeatures Test samples For some estimators this may

be a precomputed kernel matrix instead shape nsamples nsamplesfitted where

nsamplesfitted is the number of samples used in the fitting for the estimator

yarraylike shape nsamples or nsamples noutputs True values for X

sampleweight arraylike shape nsamples optional Sample weights

Returns

score float R2 of selfpredictX wrt y

Notes

The R2 score used when calling score on a regressor will use multioutputuniformaverage

from version 023 to keep consistent with metricsr2score This will influence the score

method of all the multioutput regressors except for multioutputMultiOutputRegressor

To specify the default value manually and avoid the warning please either call metricsr2score

directly or make a custom scorer with metricsmakescorer the builtin scorer r2 uses

multioutputuniformaverage

setparams selfparams

Set the parameters of this estimator

The method works on simple estimators as well as on nested objects such as pipelines The latter have

parameters of the form componentparameter so that it's possible to update each component

of a nested object

Returns

self

632sklearnpipeline Pipeline

The sklearn pipeline module implements utilities to build a composite estimator as a chain of transforms and estimators

pipelineFeatureUnion transformerlist Concatenates results of multiple transformer objects

pipelinePipeline steps memory verbose Pipeline of transforms with a final estimator

6321sklearnpipeline FeatureUnion

class sklearn pipeline FeatureUnion transformerlist njobsNone transformerweightsNone

verboseFalse

Concatenates results of multiple transformer objects

This estimator applies a list of transformer objects in parallel to the input data then concatenates the results

This is useful to combine several feature extraction mechanisms into a single transformer

Parameters of the transformers may be set using its name and the parameter name separated by a " " A

transformer may be replaced entirely by setting the parameter with its name to another transformer or removed

by setting to 'drop' or None

Read more in the User Guide

Parameters

transformerlist list of string transformer tuples List of transformer objects to be applied

to the data The first half of each tuple is the name of the transformer

njobs int or None optional defaultNone Number of jobs to run in parallel None means 1

unless in a joblibparallelbackend context1means using all processors See

Glossary for more details

transformerweights dict optional Multiplicative weights for features per transformer Keys

of transformers sumncomponents is the sum of ncomponents output dimension over transformers

Examples using sklearnpipelineFeatureUnion

•Concatenating multiple feature extraction methods

6322sklearnpipeline Pipeline

classsklearnpipeline Pipeline steps memoryNone verboseFalse

Pipeline of transforms with a final estimator

Sequentially apply a list of transforms and a final estimator Intermediate steps of the pipeline must be ‘trans forms’ that is they must implement fit and transform methods The final estimator only needs to implement fit

The transformers in the pipeline can be cached using memory argument

The purpose of the pipeline is to assemble several steps that can be crossvalidated together while setting differ ent parameters For this it enables setting parameters of the various steps using their names and the parameter name separated by a ‘’ as in the example below A step’s estimator may be replaced entirely by setting the parameter with its name to another estimator or a transformer removed by setting it to ‘passthrough’ or None

Read more in the User Guide

Parameters

steps list List of name transform tuples implementing fittransform that are chained in the order in which they are chained with the last object an estimator

memory None str or object with the joblibMemory interface optional Used to cache the fit ted transformers of the pipeline By default no caching is performed If a string is given it is the path to the caching directory Enabling caching triggers a clone of the transform ers before fitting Therefore the transformer instance given to the pipeline cannot be in spected directly Use the attribute namedsteps orsteps to inspect estimators within the pipeline Caching the transformers is advantageous when fitting is time consuming verbose boolean optional If True the time elapsed while fitting each step will be printed as it is completed

Attributes

namedsteps bunch object a dictionary with attribute access Readonly attribute to access

any step parameter by user given name Keys are step names and values are steps parameters

scikitlearn user guide Release 0213

decisionfunction self X Apply transforms and decisionfunction of the final estimator

fitself X y Fit the model

fitpredict self X y Applies fitpredict of last step in pipeline after transforms

fittransform self X y Fit the model and transform with the final estimator

getparams self deep Get parameters for this estimator

predict self X predictparams Apply transforms to the data and predict with the final estimator

predictlogproba self X Apply transforms and predictlogproba of the final estimator

predictproba self X Apply transforms and predictproba of the final estimator

score self X y sampleweight Apply transforms and score with the final estimator

setparams self kwargs Set the parameters of this estimator

init selfsteps memoryNone verboseFalse

decisionfunction selfX

Apply transforms and decisionfunction of the final estimator

Parameters

Xiterable Data to predict on Must fulfill input requirements of first step of the pipeline

Returns

yscore arraylike shape nsamples nclasses

fitselfXyNone fitparams

Fit the model

Fit all the transforms one after the other and transform the data then fit the transformed data using the final estimator

Parameters

Xiterable Training data Must fulfill input requirements of first step of the pipeline

yiterable defaultNone Training targets Must fulfill label requirements for all steps of the pipeline

fitparams dict of string object Parameters passed to the fit method of each step

where each parameter name is prefixed such that parameter pfor stepshas keysp

Returns

self Pipeline This estimator

fitpredict selfXyNone fitparams

Applies fitpredict of last step in pipeline after transforms

Applies fittransforms of a pipeline to the data followed by the fitpredict method of the final estimator in the pipeline Valid only if the final estimator implements fitpredict

Parameters

Xiterable Training data Must fulfill input requirements of first step of the pipeline

yiterable defaultNone Training targets Must fulfill label requirements for all steps of the pipeline

2222 Chapter 6 API (Application Programming Interface) Reference

scikitlearn user guide Release 0213

fitparams dict of string object Parameters passed to the fit method of each step
where each parameter name is prefixed such that parameter pfor stepshas keysp

Returns

ypred arraylike

fittransform selfXyNone fitparams

Fit the model and transform with the final estimator

Fits all the transforms one after the other and transforms the data then uses fittransform on transformed
data with the final estimator

Parameters

Xiterable Training data Must fulfill input requirements of first step of the pipeline

yiterable defaultNone Training targets Must fulfill label requirements for all steps of
the pipeline

fitparams dict of string object Parameters passed to the fit method of each step
where each parameter name is prefixed such that parameter pfor stepshas keysp

Returns

Xtarraylike shape nsamples ntransformedfeatures Transformed samples

getparams selfdeepTrue

Get parameters for this estimator

Parameters

deep boolean optional If True will return the parameters for this estimator and contained
subobjects that are estimators

Returns

params mapping of string to any Parameter names mapped to their values

inversetransform

Apply inverse transformations in reverse order

All estimators in the pipeline must support inversetransform

Parameters

Xtarraylike shape nsamples ntransformedfeatures Data samples where
nsamples is the number of samples and nfeatures is the number of features Must
fulfill input requirements of last step of pipeline's inversetransform method

Returns

Xtarraylike shape nsamples nfeatures

predictselfXpredictparams

Apply transforms to the data and predict with the final estimator

Parameters

Xiterable Data to predict on Must fulfill input requirements of first step of the pipeline

predictparams dict of string object Parameters to the predict called at the end of
all transformations in the pipeline Note that while this may be used to return uncertainties
from some models with returnstd or returncov uncertainties that are generated by the
transformations in the pipeline are not propagated to the final estimator

Returns

632sklearnpipeline Pipeline 2223

scikitlearn user guide Release 0213

`ypred` arraylike

`predictlogproba` selfX

Apply transforms and `predictlogproba` of the final estimator

Parameters

Xiterable Data to predict on Must fulfill input requirements of first step of the pipeline

Returns

`yscore` arraylike shape `nsamples nclasses`

`predictproba` selfX

Apply transforms and `predictproba` of the final estimator

Parameters

Xiterable Data to predict on Must fulfill input requirements of first step of the pipeline

Returns

`yproba` arraylike shape `nsamples nclasses`

`scoreselfXyNone sampleweightNone`

Apply transforms and score with the final estimator

Parameters

Xiterable Data to predict on Must fulfill input requirements of first step of the pipeline

`yiterable defaultNone` Targets used for scoring Must fulfill label requirements for all steps of the pipeline

`sampleweight arraylike defaultNone` If not `None` this argument is passed as `sampleweight` keyword argument to the score method of the final estimator

Returns

`score` float

`setparams selfkwargs`

Set the parameters of this estimator

Valid parameter keys can be listed with `getparams`

Returns

self

`transform`

Apply transforms and transform with the final estimator

This also works where final estimator is `None` all prior transformations are applied

Parameters

Xiterable Data to transform Must fulfill input requirements of first step of the pipeline

Returns

Xtarraylike shape `nsamples ntransformedfeatures`

2224 Chapter 6 API (Application Programming Interface) Reference

scikitlearn user guide Release 0213

Examples using sklearnpipelinePipeline

- Explicit feature map approximation for RBF (Radial Basis Function) kernels
- Feature agglomeration vs univariate selection
- Concatenating multiple feature extraction methods
- Pipelining chaining a PCA (Principal Component Analysis) and a logistic regression
- Column Transformer with Mixed Types
- Selecting dimensionality reduction with Pipeline and GridSearchCV
- Column Transformer with Heterogeneous Data Sources
- Underfitting vs Overfitting
- Balance model complexity and crossvalidated score
- Sample pipeline for text feature extraction and evaluation
- Comparing Nearest Neighbors with and without Neighborhood Components Analysis
- Restricted Boltzmann Machine features for digit classification
- SVMAnova SVM (Support Vector Machine) with univariate feature selection
- Classification of text documents using sparse features

pipelinemakepipeline steps kwargs Construct a Pipeline from the given estimators

pipelinemakeunion transformers kwargs Construct a FeatureUnion from the given transformers

6323sklearnpipeline makepipeline

sklearnpipeline makepipeline steps kwargs

Construct a Pipeline from the given estimators

This is a shorthand for the Pipeline constructor it does not require and does not permit naming the estimators

Instead their names will be set to the lowercase of their types automatically

Parameters

steps list of estimators

memory None str or object with the joblibMemory interface optional Used to cache the fit

ted transformers of the pipeline By default no caching is performed If a string is given

it is the path to the caching directory Enabling caching triggers a clone of the transform

ers before fitting Therefore the transformer instance given to the pipeline cannot be in

spected directly Use the attribute namedsteps orsteps to inspect estimators within

the pipeline Caching the transformers is advantageous when fitting is time consuming

verbose boolean optional If True the time elapsed while fitting each step will be printed as it

is completed

Returns

pPipeline

633sklearninspection inspection

The sklearninspection module includes tools for model inspection

inspectionpartialdependence estimator X

Partial dependence of features

inspectionplotpartialdependence

Partial dependence plots

6331sklearninspection partialdependence

sklearninspection partialdependence estimator Xfeatures responsemethod'auto'

percentiles005 095 gridresolution100

method'auto'

Partial dependence of features

Partial dependence of a feature or a set of features corresponds to the average response of an estimator for each possible value of the feature

Read more in the User Guide

Parameters

estimator BaseEstimator A fitted estimator object implementing predict predictproba or

decisionfunction Multioutputmulticlass classifiers are not supported

Xarraylike shape nsamples nfeatures Xis used both to generate a grid of values for the

features and to compute the averaged predictions when method is 'brute'

633sklearninspection inspection 2227

scikitlearn user guide Release 0213

features list or arraylike of int The target features for which the partial dependency should be computed

response method 'auto' 'predictproba' or 'decisionfunction' optional default 'auto'

Specifies whether to use predictproba or decisionfunction as the target response For regressors this parameter is ignored and the response is always the output of predict By default predictproba is tried first and we revert to decisionfunction if it doesn't exist If method is 'recursion' the response is always the output of decisionfunction

percentiles tuple of float optional default (0.05, 0.95) The lower and upper percentile used to create the extreme values for the grid Must be in [0, 1]

grid resolution int optional default 100 The number of equally spaced points on the grid for each target feature

method str optional default 'auto' The method used to calculate the averaged predictions

- 'recursion' is only supported for objects inheriting from BaseGradientBoosting but is more efficient in terms of speed With this method X is only used to build the grid and the partial dependences are computed using the training data This method does not account for the init predictor of the boosting process which may lead to incorrect values see warning below With this method the target response of a classifier is always the decision function not the predicted probabilities

- 'brute' is supported for any estimator but is more computationally intensive

- If 'auto' then 'recursion' will be used for BaseGradientBoosting estimators with

init=None and 'brute' for all other

Returns

averaged_predictions ndarray shape (n_outputs, len(values_0), len(values_1), ...) The predictions for all the points in the grid averaged over all samples in X or over the training data

if method is 'recursion' n_outputs corresponds to the number of classes in a multi-class setting or to the number of tasks for multioutput regression For classical regression and binary classification n_outputs=1 n_values[feature_j] corresponds to the size of values_j

values seq of 1d ndarrays The values with which the grid has been created The generated grid is a cartesian product of the arrays in values len(values)=len(features)

The size of each array values_j is either grid_resolution or the number of unique values in X[j] whichever is smaller

Warning The 'recursion' method only works for gradient boosting estimators and unlike the 'brute' method it does not account for the init predictor of the boosting process In practice this will produce the same values as 'brute' up to a constant offset in the target response provided that init is a constant estimator which is the default However as soon as init is not a constant estimator the partial dependence values are incorrect for 'recursion'

Read more in the User Guide

Parameters

estimator BaseEstimator A fitted estimator object implementing predict predictproba or decisionfunction Multioutputmulticlass classifiers are not supported

Xarraylike shape nsamples nfeatures The data to use to build the grid of values on

which the dependence will be evaluated This is usually the training data

features list of int str pair of int pair of str The target features for which to create the

PDPs If featuresi is an int or a string a oneway PDP is created if featuresi is a tuple a

twoway PDP is created Each tuple must be of size 2 if any entry is a string then it must

be infeaturenames

featurenames seq of str shape nfeatures optional Name of each feature fea

turenamesi holds the name of the feature with index i By default the name of the feature

corresponds to their numerical index

target int optional defaultNone

• In a multiclass setting specifies the class for which the PDPs should be computed Note that for binary classification the positive class index 1 is always used

• In a multioutput setting specifies the task for which the PDPs should be computed

Ignored in binary classification or classical regression settings

responsemethod 'auto' 'predictproba' or 'decisionfunction' optional default'auto'

Specifies whether to use predictproba ordecisionfunction as the target response For

regressors this parameter is ignored and the response is always the output of predict By

633sklearninspection inspection 2229

scikitlearn user guide Release 0213

default predictproba is tried first and we revert to decisionfunction if it doesn't exist If method is 'recursion' the response is always the output of decisionfunction ncols int optional default3 The maximum number of columns in the grid plot gridresolution int optional default100 The number of equally spaced points on the axes of the plots for each target feature percentiles tuple of float optional default005 095 The lower and upper percentile used to create the extreme values for the PDP axes Must be in 0 1 method str optional default'auto' The method to use to calculate the partial dependence predictions

- 'recursion' is only supported for objects inheriting from BaseGradientBoosting but is more efficient in terms of speed With this method Xis optional and is only used to build the grid and the partial dependences are computed using the training data This method does not account for the init predictor of the boosting process which may lead to incorrect values see warning below With this method the target response of a classifier is always the decision function not the predicted probabilities
- 'brute' is supported for any estimator but is more computationally intensive
- If 'auto' then 'recursion' will be used for BaseGradientBoosting estimators with initNone and 'brute' for all other

Unlike the 'brute' method 'recursion' does not account for the init predictor of the boosting process In practice this still produces the same plots up to a constant offset in the target response

njobs int optional defaultNone The number of CPUs to use to compute the partial dependencesNone means 1 unless in a joblibparallelbackend context1means using all processors See Glossary for more details

verbose int optional default0 Verbose output during PD computations

figMatplotlib figure object optional defaultNone A figure object onto which the plots will be drawn after the figure has been cleared By default a new one is created

linekw dict optional Dict with keywords passed to the matplotlib.pyplot.plot call

For oneway partial dependence plots

contourkw dict optional Dict with keywords passed to the matplotlib.pyplot.plot call

For twoway partial dependence plots

Warning The 'recursion' method only works for gradient boosting estimators and unlike the 'brute' method it does not account for the init predictor of the boosting process In practice this will produce the same values as 'brute' up to a constant offset in the target response provided that init is a constant estimator which is the default However as soon as init is not a constant estimator the partial dependence values are incorrect for 'recursion'

634 sklearn.preprocessing: Preprocessing and Normalization

The sklearn.preprocessing module includes scaling, centering, normalization, binarization, and imputation methods.

User guide: See the Preprocessing data section for further details.

preprocessing.Binarizer: threshold. Copy binarize data set feature values to 0 or 1 according to a threshold.

preprocessing.FunctionTransformer: func

Constructs a transformer from an arbitrary callable.

preprocessing.KBinsDiscretizer: nbins

Bin continuous data into intervals.

preprocessing.KernelCenterer: Center a kernel matrix.

preprocessing.LabelBinarizer: neg_label

Binarize labels in a one-vs-all fashion.

preprocessing.LabelEncoder: Encode labels with value between 0 and n_classes-1.

preprocessing.MultiLabelBinarizer: classes

Transform between iterable of iterables and a multilabel.

format

preprocessing.MaxAbsScaler: copy. Scale each feature by its maximum absolute value.

preprocessing.MinMaxScaler: feature_range

copy. Transform features by scaling each feature to a given

range.

preprocessing.Normalizer: norm, copy. Normalize samples individually to unit norm.

preprocessing.OneHotEncoder: n_values. Encode categorical integer features as a one-hot numeric array.

preprocessing.OrdinalEncoder: categories

dtype. Encode categorical features as an integer array.

preprocessing.PolynomialFeatures: degree

Generate polynomial and interaction features.

preprocessing.PowerTransformer: method

Apply a power transform featurewise to make data more

Gaussian-like.

preprocessing.QuantileTransformer. Transform features using quantiles information.

preprocessing.RobustScaler: with_centering

Scale features using statistics that are robust to outliers.

preprocessing.StandardScaler: copy. Standardize features by removing the mean and scaling to unit variance.

634 sklearn.preprocessing: Preprocessing and Normalization 2231

scikitlearn user guide Release 0213

6341sklearnpreprocessing Binarizer

classsklearnpreprocessing Binarizer threshold00 copyTrue

Binarize data set feature values to 0 or 1 according to a threshold

Values greater than the threshold map to 1 while values less than or equal to the threshold map to 0 With the default threshold of 0 only positive values map to 1

Binarization is a common operation on text count data where the analyst can decide to only consider the presence or absence of a feature rather than a quantified number of occurrences for instance

It can also be used as a preprocessing step for estimators that consider boolean random variables eg modelled using the Bernoulli distribution in a Bayesian setting

Read more in the User Guide

Parameters

threshold float optional 00 by default Feature values below or equal to this are replaced by 0 above it by 1 Threshold may not be less than 0 for operations on sparse matrices

copy boolean optional default True set to False to perform inplace binarization and avoid a

copy if the input is already a numpy array or a scipysparse CSR (Compressed Sparse Row) matrix

See also

binarize Equivalent function without the estimator API (Application Programming Interface)

Notes

If the input is a sparse matrix only the nonzero values are subject to update by the Binarizer class

This estimator is stateless besides constructor parameters the fit method does nothing but is useful when used in a pipeline

Examples

from sklearnpreprocessing import Binarizer

X 1 1 2

2 0 0

0 1 1

transformer BinarizerfitX fit does nothing

transformer

scikitlearn user guide Release 0213

Table 6247 – continued from previous page

setparams self params Set the parameters of this estimator

transform self X copy Binarize each element of X

init selfthreshold00 copyTrue

fitselfXyNone

Do nothing and return the estimator unchanged

This method is just there to implement the usual API (Application Programming Interface) and hence work in pipelines

Parameters

Xarraylike

fittransform selfXyNone fitparams

Fit to data then transform it

Fits transformer to X and y with optional parameters fitparams and returns a transformed version of X

Parameters

Xnumpy array of shape nsamples nfeatures Training set

ynumpy array of shape nsamples Target values

Returns

Xnew numpy array of shape nsamples nfeaturesnew Transformed array

getparams selfdeepTrue

Get parameters for this estimator

Parameters

deep boolean optional If True will return the parameters for this estimator and contained

subobjects that are estimators

Returns

params mapping of string to any Parameter names mapped to their values

setparams selfparams

Set the parameters of this estimator

The method works on simple estimators as well as on nested objects such as pipelines The latter have

parameters of the form componentparameter so that it’s possible to update each component

of a nested object

Returns

self

transform selfXcopyNone

Binarize each element of X

Parameters

Xarraylike sparse matrix shape nsamples nfeatures The data to binarize element

by element scipysparse matrices should be in CSR (Compressed Sparse Row) format to avoid an unnecessary copy

copy bool Copy the input X or not

634sklearnpreprocessing Preprocessing and Normalization 2233

scikitlearn user guide Release 0213

6342sklearnpreprocessing FunctionTransformer

classsklearnpreprocessing FunctionTransformer funcNone inversefuncNone val

idateNone acceptsparseFalse

passy'deprecated'

checkinverseTrue kwargsNone

invkwargsNone

Constructs a transformer from an arbitrary callable

A FunctionTransformer forwards its X and optionally y arguments to a userdefined function or function

object and returns the result of this function This is useful for stateless transformations such as taking the log

of frequencies doing custom scaling etc

Note If a lambda is used as the function then the resulting transformer will not be pickleable

New in version 017

Read more in the User Guide

Parameters

func callable optional defaultNone The callable to use for the transformation This will be

passed the same arguments as transform with args and kwargs forwarded If func is None

then func will be the identity function

inversefunc callable optional defaultNone The callable to use for the inverse transforma

tion This will be passed the same arguments as inverse transform with args and kwargs

forwarded If inversefunc is None then inversefunc will be the identity function

validate bool optional defaultTrue Indicate that the input X array should be checked before

callingfunc The possibilities are

- If False there is no input validation

- If True then X will be converted to a 2dimensional NumPy array or sparse matrix If the

conversion is not possible an exception is raised

Deprecated since version 020 validateTrue as default will be replaced by

validateFalse in 022

acceptsparse boolean optional Indicate that func accepts a sparse matrix as input If validate

is False this has no effect Otherwise if acceptsparse is false sparse matrix inputs will

cause an exception to be raised

passy bool optional defaultFalse Indicate that transform should forward the y argument to

the inner callable

Deprecated since version 019

checkinverse bool defaultTrue Whether to check that or func followed by

inversefunc leads to the original inputs It can be used for a sanity check raising

a warning when the condition is not fulfilled

New in version 020

kwargs dict optional Dictionary of additional keyword arguments to pass to func

invkwargs dict optional Dictionary of additional keyword arguments to pass to in

versefunc

634sklearnpreprocessing Preprocessing and Normalization 2235

scikitlearn user guide Release 0213

setparams selfparams

Set the parameters of this estimator

The method works on simple estimators as well as on nested objects such as pipelines The latter have parameters of the form componentparameter so that it's possible to update each component of a nested object

Returns

self

transform selfX

Transform X using the forward function

Parameters

Xarraylike shape nsamples nfeatures Input array

Returns

Xout arraylike shape nsamples nfeatures Transformed input

Examples using sklearnpreprocessingFunctionTransformer

•Using FunctionTransformer to select columns

6343sklearnpreprocessing KBinsDiscretizer

classsklearnpreprocessing KBinsDiscretizer nbins5 encode'onehot' strat
egy'quantile'

Bin continuous data into intervals

Read more in the User Guide

Parameters

nbins int or arraylike shape nfeatures default5 The number of bins to produce

Raises ValueError if nbins 2

encode 'onehot' 'onehotdense' 'ordinal' default'onehot' Method used to encode the transformed result

onehot Encode the transformed result with onehot encoding and return a sparse matrix Ignored features are always stacked to the right

onehotdense Encode the transformed result with onehot encoding and return a dense array Ignored features are always stacked to the right

ordinal Return the bin identifier encoded as an integer value

strategy 'uniform' 'quantile' 'kmeans' default'quantile' Strategy used to define the widths of the bins

uniform All bins in each feature have identical widths

quantile All bins in each feature have the same number of points

kmeans Values in each bin have the same nearest center of a 1D kmeans cluster

Attributes

nbins int array shape nfeatures Number of bins per feature Bins whose width are too small ie 1e8 are removed with a warning

2236 Chapter 6 API (Application Programming Interface) Reference

scikitlearn user guide Release 0213

binedges array of arrays shape nfeatures The edges of each bin Contain arrays of varying shapes nbins Ignored features will have empty arrays

See also

sklearnpreprocessingBinarizer class used to bin values as 0or1based on a parameter threshold

Notes

In bin edges for feature i the first and last values are used only for inversetransform During transform bin edges are extended to

npconcatenatenpinf binedgesi11 npinf

You can combine KBinsDiscretizer withsklearncomposeColumnTransformer if you only want to preprocess part of the features

KBinsDiscretizer might produce constant features eg when encode onehot and certain bins

do not contain any data These features can be removed with feature selection algorithms eg sklearn

featureselectionVarianceThreshold

setparams self params Set the parameters of this estimator

transform self X Discretizes the data

init selfnbins5 encode'onehot' strategy'quantile'

fitselfXyNone

Fits the estimator

Parameters

Xnumeric arraylike shape nsamples nfeatures Data to be discretized

yignored

Returns

self

fittransform selfXyNone fitparams

Fit to data then transform it

Fits transformer to X and y with optional parameters fitparams and returns a transformed version of X

Parameters

Xnumpy array of shape nsamples nfeatures Training set

ynumpy array of shape nsamples Target values

Returns

Xnew numpy array of shape nsamples nfeaturesnew Transformed array

getparams selfdeepTrue

Get parameters for this estimator

Parameters

deep boolean optional If True will return the parameters for this estimator and contained

subobjects that are estimators

Returns

params mapping of string to any Parameter names mapped to their values

inversetransform selfXt

Transforms discretized data back to original feature space

Note that this function does not regenerate the original data due to discretization rounding

Parameters

Xnumeric arraylike shape nsample nfeatures Transformed data in the binned space

Returns

Xinv numeric arraylike Data in the original feature space

2238 Chapter 6 API (Application Programming Interface) Reference

scikitlearn user guide Release 0213

setparams selfparams

Set the parameters of this estimator

The method works on simple estimators as well as on nested objects such as pipelines The latter have parameters of the form componentparameter so that it's possible to update each component of a nested object

Returns

self

transform selfX

Discretizes the data

Parameters

Xnumeric arraylike shape nsamples nfeatures Data to be discretized

Returns

Xnumeric arraylike or sparse matrix Data in the binned space

Examples using sklearnpreprocessingKBinsDiscretizer

- Using KBinsDiscretizer to discretize continuous features
- Demonstrating the different strategies of KBinsDiscretizer
- Feature discretization

6344sklearnpreprocessing KernelCenterer

classsklearnpreprocessing KernelCenterer

Center a kernel matrix

Let $K_{x,z}$ be a kernel defined by $\phi(x)^T \phi(z)$ where ϕ is a function mapping x to a Hilbert space

KernelCenterer centers ie normalize to have zero mean the data without explicitly computing $\phi(x)$ It is equivalent to centering $\phi(x)$ with sklearnpreprocessingStandardScalerwithstdFalse

Read more in the User Guide

Examples

```
from sklearnpreprocessing import KernelCenterer
from sklearnmetricspairwise import pairwise_kernels
```

```
X = [[1, 2, 2],
```

```
     [2, 1, 3],
```

```
     [4, 1, 2]]
```

```
K = pairwise_kernels(X, metric='linear')
```

```
K
```

```
array([[9, 2, 2],
```

```
       [2, 14, 13],
```

```
       [2, 13, 21]])
```

```
transformer = KernelCenterer().fit(K)
```

```
transformer

6345sklearnpreprocessing LabelBinarizer

classssklearnpreprocessing LabelBinarizer neglabel0 poslabel1

sparseoutputFalse

Binarize labels in a onevsall fashion

Several regression and binary classification algorithms are available in scikitlearn A simple way to extend

these algorithms to the multiclass classification case is to use the socalled onevsall scheme

At learning time this simply consists in learning one regressor or binary classifier per class In doing so one

needs to convert multiclass labels to binary labels belong or does not belong to the class LabelBinarizer

makes this process easy with the transform method

At prediction time one assigns the class for which the corresponding model gave the greatest confidence La

belBinarizer makes this easy with the inversetransform method

Read more in the User Guide

Parameters

neglabel int default 0 Value with which negative labels must be encoded

poslabel int default 1 Value with which positive labels must be encoded

sparseoutput boolean default False True if the returned array from transform is desired to

be in sparse CSR (Compressed Sparse Row) format

Attributes

classes array of shape nclass Holds the label for each class

ytype str Represents the type of the target data as evaluated by

utilsmulticlasstypeoftarget Possible type are ‘continuous’ ‘continuousmultioutput’

‘binary’ ‘multiclass’ ‘multiclassmultioutput’ ‘multilabelindicator’ and ‘unknown’

sparseinput boolean True if the input data to transform is given as a sparse matrix False

otherwise

sklearnpreprocessingOneHotEncoder encode categorical features using a onehot aka oneofK

scheme

634sklearnpreprocessing Preprocessing and Normalization 2241

scikitlearn user guide Release 0213

Examples

```
from sklearn import preprocessing
lb = preprocessing.LabelBinarizer
lb.fit([2, 6, 4, 2])
LabelBinarizer(neg_label=0, pos_label=1, sparse_output=False)
lb.classes_
array([2, 4, 6])
lb.transform([1, 6])
array([[1, 0, 0, 0],
       [0, 0, 0, 1]])
```

Binary targets transform to a column vector

```
lb = preprocessing.LabelBinarizer
lb.fit_transform([yes, no, no, yes])
array([0,
       0,
       1,
       1])
```

Passing a 2D matrix for multilabel classification

```
import numpy as np
lb.fit(np.array([[0, 1, 1, 1, 0, 0],
                 [1, 0, 0, 0, 1, 0]]))
LabelBinarizer(neg_label=0, pos_label=1, sparse_output=False)
lb.classes_
array([0, 1, 2])
lb.transform([[0, 1, 2, 1]])
array([[1, 0, 0],
       [0, 1, 0],
       [0, 0, 1],
       [0, 1, 0]])
```

Methods

```
fit(self, y) Fit label binarizer
fit_transform(self, y) Fit label binarizer and transform multiclass labels to binary labels
get_params(self, deep=True) Get parameters for this estimator
inverse_transform(self, Y) Transform binary labels back to multiclass labels
set_params(self, **params) Set the parameters of this estimator
transform(self, y) Transform multiclass labels to binary labels
init(self, neg_label=0, pos_label=1, sparse_output=False)
fit(self, y)
```

Fit label binarizer

Parameters

y array of shape (n_samples, or n_samples, n_classes) Target values. The 2d matrix should only contain 0 and 1, represents multilabel classification.

Returns

2242 Chapter 6 API (Application Programming Interface) Reference

scikitlearn user guide Release 0213

self returns an instance of self

fittransform selfy

Fit label binarizer and transform multiclass labels to binary labels

The output of transform is sometimes referred to as the 1ofK coding scheme

Parameters

yarray or sparse matrix of shape nsamples or nsamples nclasses Target values

The 2d matrix should only contain 0 and 1 represents multilabel classification Sparse

matrix can be CSR (Compressed Sparse Row) CSC COO DOK or LIL

Returns

Yarray or CSR (Compressed Sparse Row) matrix of shape nsamples nclasses Shape will be nsamples 1 for

binary problems

getparams selfdeepTrue

Get parameters for this estimator

Parameters

deep boolean optional If True will return the parameters for this estimator and contained

subobjects that are estimators

Returns

params mapping of string to any Parameter names mapped to their values

inversetransform selfYthresholdNone

Transform binary labels back to multiclass labels

Parameters

Ynumpy array or sparse matrix with shape nsamples nclasses Target values All

sparse matrices are converted to CSR (Compressed Sparse Row) before inverse transformation

threshold float or None Threshold used in the binary and multilabel cases

Use 0 when Ycontains the output of decisionfunction classifier Use 05 when Ycon

tains the output of predictproba

If None the threshold is assumed to be half way between neglabel and poslabel

Returns

ynumpy array or CSR (Compressed Sparse Row) matrix of shape nsamples Target values

Notes

In the case when the binary labels are fractional probabilistic inversetransform chooses the class with

the greatest value Typically this allows to use the output of a linear model's decisionfunction method

directly as the input of inversetransform

setparams selfparams

Set the parameters of this estimator

The method works on simple estimators as well as on nested objects such as pipelines The latter have

parameters of the form componentparameter so that it's possible to update each component

of a nested object

Returns

634sklearnpreprocessing Preprocessing and Normalization 2243

scikitlearn user guide Release 0213

self

transform selfy

Transform multiclass labels to binary labels

The output of transform is sometimes referred to by some authors as the 1ofK coding scheme

Parameters

yarray or sparse matrix of shape nsamples or nsamples nclasses Target values

The 2d matrix should only contain 0 and 1 represents multilabel classification Sparse

matrix can be CSR (Compressed Sparse Row) CSC COO DOK or LIL

Returns

Ynumpy array or CSR (Compressed Sparse Row) matrix of shape nsamples nclasses Shape will be nsamples

1 for binary problems

6346sklearnpreprocessing LabelEncoder

classsklearnpreprocessing LabelEncoder

Encode labels with value between 0 and nclasses1

Returns

yarraylike of shape nsamples

6347sklearnpreprocessing MultiLabelBinarizer

classsklearnpreprocessing MultiLabelBinarizer classesNone sparseoutputFalse

Transform between iterable of iterables and a multilabel format

Although a list of sets or tuples is a very intuitive format for multilabel data it is unwieldy to process This transformer converts between this intuitive format and the supported multilabel format a samples x classes binary matrix indicating the presence of a class label

Parameters

classes arraylike of shape nclasses optional Indicates an ordering for the class labels All

entries should be unique cannot contain duplicate classes

sparseoutput boolean default False Set to true if output binary array is desired in CSR (Compressed Sparse Row)

sparse format

Attributes

classes array of labels A copy of the classes parameter where provided or otherwise the

sorted set of classes found when fitting

Returns

self

transform selfy

Transform the given label sets

Parameters

yiterable of iterables A set of labels any orderable and hashable object for each sample

If theclasses parameter is set ywill not be iterated

Returns

yindicator array or CSR (Compressed Sparse Row) matrix shape nsamples nclasses A matrix such that yindicatori j 1 iffclassesj is inyi and 0 otherwise

6348sklearnpreprocessing MaxAbsScaler

classsklearnpreprocessing MaxAbsScaler copyTrue

Scale each feature by its maximum absolute value

This estimator scales and translates each feature individually such that the maximal absolute value of each feature in the training set will be 10 It does not shiftcenter the data and thus does not destroy any sparsity

This scaler can also be applied to sparse CSR (Compressed Sparse Row) or CSC matrices

New in version 017

Parameters

copy boolean optional default is True Set to False to perform inplace scaling and avoid a copy if the input is already a numpy array

Attributes

scale ndarray shape nfeatures Per feature relative scaling of the data

New in version 017 scale attribute

maxabs ndarray shape nfeatures Per feature maximum absolute value

nsamplesseen int The number of samples processed by the estimator Will be reset on new calls to fit but increments across partialfit calls

See also

maxabsscale Equivalent function without the estimator API (Application Programming Interface)

2248 Chapter 6 API (Application Programming Interface) Reference

Notes

NaNs are treated as missing values disregarded in fit and maintained in transform

For a comparison of the different scalers transformers and normalizers see exam

plespreprocessingplotallscalingpy

Examples

```
from sklearn.preprocessing import MaxAbsScaler
```

```
X = [[1, 1, 2],
```

```
     [2, 0, 0],
```

```
     [0, 1, 1]]
```

```
transformer = MaxAbsScaler()fit(X)
```

```
transformer
```

```
MaxAbsScaler(copy=True,
```

```
transformer.transform(X)
```

```
array([[0.5, 1., 1.],
```

```
       [1., 0., 0.],
```

```
       [0., 1., 0.5]])
```

Methods

fit(self, X, y) Compute the maximum absolute value to be used for

later scaling

fit_transform(self, X, y) Fit to data then transform it

get_params(self, deep=True) Get parameters for this estimator

inverse_transform(self, X) Scale back the data to the original representation

partial_fit(self, X, y) Online computation of max absolute value of X for later scaling

set_params(self, **kwargs) Set the parameters of this estimator

transform(self, X) Scale the data

init(self, copy=True)

fit(self, X, y=None)

Compute the maximum absolute value to be used for later scaling

Parameters

Xarraylike sparse matrix shape (n_samples, n_features) The data used to compute the perfeature minimum and maximum used for later scaling along the features axis

fit_transform(self, X, y=None, fit_params=None)

Fit to data then transform it

Fits transformer to X and y with optional parameters fit_params and returns a transformed version of X

Parameters

Xnumpy array of shape (n_samples, n_features) Training set

ynumpy array of shape (n_samples,) Target values

Returns

634sklearn.preprocessing Preprocessing and Normalization 2249

scikitlearn user guide Release 0213

Xnew numpy array of shape nsamples nfeaturesnew Transformed array

getparams selfdeepTrue

Get parameters for this estimator

Parameters

deep boolean optional If True will return the parameters for this estimator and contained

subobjects that are estimators

Returns

params mapping of string to any Parameter names mapped to their values

inversetransform selfX

Scale back the data to the original representation

Parameters

Xarraylike sparse matrix The data that should be transformed back

partialfit selfXyNone

Online computation of max absolute value of X for later scaling All of X is processed as a single batch

This is intended for cases when fit is not feasible due to very large number of nsamples or because X

is read from a continuous stream

Parameters

Xarraylike sparse matrix shape nsamples nfeatures The data used to compute the

mean and standard deviation used for later scaling along the features axis

ylgnored

setparams selfparams

Set the parameters of this estimator

The method works on simple estimators as well as on nested objects such as pipelines The latter have

parameters of the form componentparameter so that it's possible to update each component

of a nested object

Returns

self

transform selfX

Scale the data

Parameters

Xarraylike sparse matrix The data that should be scaled

Examples using sklearnpreprocessingMaxAbsScaler

•Compare the effect of different scalers on data with outliers

6349sklearnpreprocessing MinMaxScaler

classsklearnpreprocessing MinMaxScaler featurerange0 1copyTrue

Transforms features by scaling each feature to a given range

This estimator scales and translates each feature individually such that it is in the given range on the training set

eg between zero and one

2250 Chapter 6 API (Application Programming Interface) Reference

scikitlearn user guide Release 0213

The transformation is given by

$X_{std} = \frac{X - X_{minaxis0}}{X_{maxaxis0} - X_{minaxis0}}$

$X_{scaled} = X_{std} \cdot \max(\min, \min)$

where \min, \max = featurerange

The transformation is calculated as

$X_{scaled} = \text{scale} \cdot X - \min(X_{minaxis0}, \text{scale})$

where $\text{scale} = \max(\min, X_{maxaxis0} - X_{minaxis0})$

This transformation is often used as an alternative to zero mean unit variance scaling

Read more in the User Guide

Parameters

featurerange tuple min max default(0, 1) Desired range of transformed data

copy boolean optional default True Set to False to perform inplace row normalization and

avoid a copy if the input is already a numpy array

Attributes

min ndarray shape nfeatures Per feature adjustment for minimum Equivalent to min

$X_{minaxis0}$ selfscale

scale ndarray shape nfeatures Per feature relative scaling of the data Equivalent to max

$\min(X_{maxaxis0}, X_{minaxis0})$

New in version 0.17 scale attribute

datamin ndarray shape nfeatures Per feature minimum seen in the data

New in version 0.17 datamin

datamax ndarray shape nfeatures Per feature maximum seen in the data

New in version 0.17 datamax

datarange ndarray shape nfeatures Per feature range datamax

datamin seen in the data

New in version 0.17 datarange

deep boolean optional If True will return the parameters for this estimator and contained subobjects that are estimators

Returns

params mapping of string to any Parameter names mapped to their values

inversetransform selfX

Undo the scaling of X according to featurerange

Parameters

Xarraylike shape nsamples nfeatures Input data that will be transformed It cannot be sparse

partialfit selfXyNone

Online computation of min and max on X for later scaling All of X is processed as a single batch This is intended for cases when fit is not feasible due to very large number of nsamples or because X is read from a continuous stream

Parameters

Xarraylike shape nsamples nfeatures The data used to compute the mean and standard deviation used for later scaling along the features axis

yIgnored

setparams selfparams

Set the parameters of this estimator

The method works on simple estimators as well as on nested objects such as pipelines The latter have parameters of the form componentparameter so that it's possible to update each component of a nested object

Returns

self

transform selfX

Scaling features of X according to featurerange

Parameters

Xarraylike shape nsamples nfeatures Input data that will be transformed

Examples using sklearnpreprocessingMinMaxScaler

- Compare Stochastic learning strategies for MLPClassifier
- Compare the effect of different scalers on data with outliers

63410sklearnpreprocessing Normalizer

classsklearnpreprocessing Normalizer norm'12' copyTrue

Normalize samples individually to unit norm

Each sample ie each row of the data matrix with at least one non zero component is rescaled independently of other samples so that its norm l1 or l2 equals one

This transformer is able to work both with dense numpy arrays and scipysparse matrix use CSR (Compressed Sparse Row) format if you want to avoid the burden of a copy conversion

634sklearnpreprocessing Preprocessing and Normalization 2253

scikitlearn user guide Release 0213

Scaling inputs to unit norms is a common operation for text classification or clustering for instance For instance the dot product of two l2normalized TFIDF vectors is the cosine similarity of the vectors and is the base similarity metric for the Vector Space Model commonly used by the Information Retrieval community

Read more in the User Guide

Parameters

norm 'l1' 'l2' or 'max' optional 'l2' by default The norm to use to normalize each non

zero sample

copy boolean optional default True set to False to perform inplace row normalization and

avoid a copy if the input is already a numpy array or a scipysparse CSR (Compressed Sparse Row) matrix

See also

normalize Equivalent function without the estimator API (Application Programming Interface)

Notes

This estimator is stateless besides constructor parameters the fit method does nothing but is useful when used in a pipeline

Parameters

deep boolean optional If True will return the parameters for this estimator and contained

subobjects that are estimators

Returns

params mapping of string to any Parameter names mapped to their values

setparams selfparams

Set the parameters of this estimator

The method works on simple estimators as well as on nested objects such as pipelines The latter have

parameters of the form componentparameter so that it's possible to update each component

of a nested object

Returns

self

transform selfXcopyNone

Scale each non zero row of X to unit norm

Parameters

Xarraylike sparse matrix shape nsamples nfeatures The data to normalize row

by row scipysparse matrices should be in CSR (Compressed Sparse Row) format to avoid an unnecessary copy

copy bool optional default None Copy the input X or not

Examples using sklearnpreprocessingNormalizer

•Compare the effect of different scalers on data with outliers

•Clustering text documents using kmeans

634sklearnpreprocessing Preprocessing and Normalization 2255

Encode categorical integer features as a onehot numeric array

The input to this transformer should be an arraylike of integers or strings denoting the values taken on by

categorical discrete features The features are encoded using a onehot aka 'oneofK' or 'dummy' encoding

scheme This creates a binary column for each category and returns a sparse matrix or dense array

By default the encoder derives the categories based on the unique values in each feature Alternatively you can

also specify the categories manually The OneHotEncoder previously assumed that the input features take

on values in the range 0 maxvalues This behaviour is deprecated

This encoding is needed for feeding categorical data to many scikitlearn estimators notably linear models and

SVMs with the standard kernels

Note a onehot encoding of y labels should use a LabelBinarizer instead

Read more in the User Guide

Parameters

categories 'auto' or a list of listsarrays of values default'auto' Categories unique values

per feature

- 'auto' Determine categories automatically from the training data
- list categoriesi holds the categories expected in the ith column The passed categories should not mix strings and numeric values within a single feature and should be sorted in case of numeric values

The used categories can be found in the categories attribute

drop 'first' or a listarray of shape nfeatures defaultNone Specifies a methodology to

use to drop one of the categories per feature This is useful in situations where perfectly

collinear features cause problems such as when feeding the resulting data into a neural

network or an unregularized regression

- None retain all features the default
- 'first' drop the first category in each feature If only one category is present the feature will be dropped entirely
- array dropi is the category in feature X i that should be dropped

sparse boolean defaultTrue Will return sparse matrix if set True else will return an array

dtype number type defaultnpfloat Desired dtype of output

handleunknown 'error' or 'ignore' default'error' Whether to raise an error or ignore if

an unknown categorical feature is present during transform default is to raise When this

parameter is set to 'ignore' and an unknown category is encountered during transform the

resulting onehot encoded columns for this feature will be all zeros In the inverse transform

an unknown category will be denoted as None

nvalues 'auto' int or array of ints default'auto' Number of values per feature

- 'auto' determine value range from training data
- inthnumber of categorical values per feature Each feature value should be in rangenvalues

scikitlearn user guide Release 0213

•array nvaluesi is the number of categorical values in X i Each feature value should be in rangenvaluesi

Deprecated since version 020 The nvalues keyword was deprecated in version 020 and will be removed in 022 Use categories instead

categoricalfeatures ‘all’ or array of indices or mask default‘all’ Specify what features are treated as categorical

- ‘all’ All features are treated as categorical
- array of indices Array of categorical feature indices
- mask Array of length nfeatures and with dtypebool

Noncategorical features are always stacked to the right of the matrix

Deprecated since version 020 The categoricalfeatures keyword was deprecated in version 020 and will be removed in 022 You can use the ColumnTransformer instead

Attributes

categories list of arrays The categories of each feature determined during fitting in order of the features in X and corresponding with the output of transform This includes the category specified in drop if any

dropidx array of shape nfeatures dropidxi is the index in categoriesi of the category to be dropped for each feature None if all the transformed features will be retained

activefeatures array Indices for active features meaning values that actually occur in the training set Only available when nvalues is auto

Deprecated since version 020 The activefeatures attribute was deprecated in version 020 and will be removed in 022

featureindices array of shape nfeatures Indices to feature ranges Feature iin the original data is mapped to features from featureindicesi to featureindicesi1 and then potentially masked by activefeatures af

terwards
Deprecated since version 020 The featureindices attribute was deprecated in version 020 and will be removed in 022

nvalues array of shape nfeatures Maximum number of values per feature

Deprecated since version 020 The nvalues attribute was deprecated in version 020 and will be removed in 022

Returns

Xout sparse matrix or a 2d array Transformed input

63413sklearnpreprocessing PolynomialFeatures

classssklearnpreprocessing PolynomialFeatures degree2 interactiononlyFalse in cludebiasTrue order'C'

Generate polynomial and interaction features

Generate a new feature matrix consisting of all polynomial combinations of the features with degree less than or equal to the specified degree For example if an input sample is two dimensional and of the form a b the

degree2 polynomial features are 1 a b a2 ab b2

Parameters

degree integer The degree of the polynomial features Default 2

interactiononly boolean default False If true only interaction features are produced features that are products of at most degree distinct input features so not x12

x0x23 etc

includebias boolean If True default then include a bias column the feature in which all polynomial powers are zero ie a column of ones acts as an intercept term in a linear model

2262 Chapter 6 API (Application Programming Interface) Reference

scikitlearn user guide Release 0213
order str in 'C' 'F' default 'C' Order of output array in the dense case 'F' order is faster
to compute but may slow down subsequent estimators
New in version 021

Attributes
powers array shape noutputfeatures ninputfeatures powers[i][j] is the exponent of
the jth input in the ith output
ninputfeatures int The total number of input features
noutputfeatures int The total number of polynomial output features The number of out
put features is computed by iterating over all suitably sized combinations of input features

Notes
Be aware that the number of features in the output array scales polynomially in the number of features of the
input array and exponentially in the degree High degrees can cause overfitting

getfeaturenames selfinputfeaturesNone

Return feature names for output features

Parameters

inputfeatures list of string length nfeatures optional String names for input features if available By default “x0” “x1” “xnfeatures” is used

Returns

outputfeaturenames list of string length noutputfeatures

getparams selfdeepTrue

Get parameters for this estimator

Parameters

deep boolean optional If True will return the parameters for this estimator and contained subobjects that are estimators

Returns

params mapping of string to any Parameter names mapped to their values

setparams selfparams

Set the parameters of this estimator

The method works on simple estimators as well as on nested objects such as pipelines The latter have parameters of the form componentparameter so that it’s possible to update each component of a nested object

Returns

self

transform selfX

Transform data to polynomial features

Parameters

Xarraylike or CSR CSC sparse matrix shape nsamples nfeatures The data to transform row by row

2264 Chapter 6 API (Application Programming Interface) Reference

scikitlearn user guide Release 0213

Prefer CSR (Compressed Sparse Row) over CSC for sparse input for speed but CSC is required if the degree is 4 or higher. If the degree is less than 4 and the input format is CSC it will be converted to CSR (Compressed Sparse Row). Polynomial features generated then converted back to CSC. If the degree is 2 or 3 the method described in “Leveraging Sparsity to Speed Up Polynomial Feature Expansions of CSR (Compressed Sparse Row) Matrices Using KSimplex Numbers” by Andrew Nysrom and John Hughes is used which is much faster than the method used on CSC input. For this reason a CSC input will be converted to CSR (Compressed Sparse Row) and the output will be converted back to CSC prior to being returned hence the preference of CSR (Compressed Sparse Row).

Returns
X: np.ndarray or CSR/CSC sparse matrix shape (n_samples, n_polynomial_features)
The matrix of features where n_polynomial_features is the number of polynomial features generated from the combination of inputs.
Examples using sklearn.preprocessing.PolynomialFeatures

- Polynomial interpolation
- Robust linear estimator fitting
- Underfitting vs Overfitting

63414 sklearn.preprocessing.PowerTransformer
class sklearn.preprocessing.PowerTransformer method 'yeo-johnson' standardize=True
copy=True

Apply a power transform featurewise to make data more Gaussian-like. Power transforms are a family of parametric monotonic transformations that are applied to make data more Gaussian-like. This is useful for modeling issues related to heteroscedasticity, nonconstant variance, or other situations where normality is desired. Currently, PowerTransformer supports the Box-Cox transform and the Yeo-Johnson transform. The optimal parameter for stabilizing variance and minimizing skewness is estimated through maximum likelihood. Box-Cox requires input data to be strictly positive, while Yeo-Johnson supports both positive or negative data. By default, zero-mean unit-variance normalization is applied to the transformed data. Read more in the User Guide.

Parameters
method: str, default='yeo-johnson' The power transform method. Available methods are:
• 'yeo-johnson' works with positive and negative values
• 'box-cox' only works with strictly positive values
standardize: boolean, default=True Set to True to apply zero-mean unit-variance normalization to the transformed output.
copy: boolean, optional, default=True Set to False to perform inplace computation during transformation.

Attributes
lambda_: array of float shape (n_features,) The parameters of the power transformation for the selected features.

63415sklearnpreprocessing QuantileTransformer

classsklearnpreprocessing QuantileTransformer nquantiles1000 out

putdistribution'uniform' ig

noreimplicitzerosFalse subsam

ple100000 randomstateNone

copyTrue

Transform features using quantiles information

This method transforms the features to follow a uniform or a normal distribution Therefore for a given feature this transformation tends to spread out the most frequent values It also reduces the impact of marginal outliers this is therefore a robust preprocessing scheme

The transformation is applied on each feature independently First an estimate of the cumulative distribution function of a feature is used to map the original values to a uniform distribution The obtained values are then mapped to the desired output distribution using the associated quantile function Features values of newunseen data that fall below or above the fitted range will be mapped to the bounds of the output distribution Note that this transform is nonlinear It may distort linear correlations between variables measured at the same scale but renders variables measured at different scales more directly comparable

Read more in the User Guide

Parameters

nquantiles int optional default1000 or nsamples Number of quantiles to be computed

It corresponds to the number of landmarks used to discretize the cumulative distribution

function If nquantiles is larger than the number of samples nquantiles is set to the number of samples as a larger number of quantiles does not give a better approximation of the cumulative distribution function estimator

outputdistribution str optional default'uniform' Marginal distribution for the trans

formed data The choices are 'uniform' default or 'normal'

ignoreimplicitzeros bool optional defaultFalse Only applies to sparse matrices If True the sparse entries of the matrix are discarded to compute the quantile statistics If False these entries are treated as zeros

subsample int optional default1e5 Maximum number of samples used to estimate the quantiles for computational efficiency Note that the subsampling procedure may differ for valueidentical sparse and dense matrices

randomstate int RandomState instance or None optional defaultNone If int ran

Examples using sklearnpreprocessingQuantileTransformer

- Effect of transforming the targets in regression model
- Map data to a normal distribution
- Compare the effect of different scalers on data with outliers

63416sklearnpreprocessing RobustScaler

classsklearnpreprocessing RobustScaler withcenteringTrue withscalingTrue quantilerange250 750 copyTrue

Scale features using statistics that are robust to outliers

This Scaler removes the median and scales the data according to the quantile range defaults to IQR Interquartile Range The IQR is the range between the 1st quartile 25th quantile and the 3rd quartile 75th quantile

Centering and scaling happen independently on each feature by computing the relevant statistics on the samples in the training set Median and interquartile range are then stored to be used on later data using the transform method

Standardization of a dataset is a common requirement for many machine learning estimators Typically this is done by removing the mean and scaling to unit variance However outliers can often influence the sample mean variance in a negative way In such cases the median and the interquartile range often give better results

New in version 017

Read more in the User Guide

Parameters

withcentering boolean True by default If True center the data before scaling This will causetransform to raise an exception when attempted on sparse matrices because centering them entails building a dense matrix which in common use cases is likely to be too large to fit in memory

withscaling boolean True by default If True scale the data to interquartile range

quantilerange tuple qmin qmax 00 qmin qmax 1000 Default 250 750

1st quartile 3rd quartile IQR Quantile range used to calculate scale

New in version 018

copy boolean optional default is True If False try to avoid a copy and do inplace scaling instead This is not guaranteed to always work inplace eg if the data is not a NumPy array or scipysparse CSR (Compressed Sparse Row) matrix a copy may still be returned

634sklearnpreprocessing Preprocessing and Normalization 2271

scikitlearn user guide Release 0213

Attributes

center array of floats The median value for each feature in the training set

scale array of floats The scaled interquartile range for each feature in the training set

set_params(self, **params) Set the parameters of this estimator

transform(self, X) Center and scale the data

__init__(self, with_centering=True, with_scaling=True, quantile_range=(250, 750), copy=True)

fit(self, X, y=None)

Compute the median and quantiles to be used for scaling

Parameters

2272 Chapter 6: API (Application Programming Interface) Reference

scikitlearn user guide Release 0213

Xarraylike shape nsamples nfeatures The data used to compute the median and quantiles used for later scaling along the features axis

fittransform selfXyNone fitparams

Fit to data then transform it

Fits transformer to X and y with optional parameters fitparams and returns a transformed version of X

Parameters

Xnumpy array of shape nsamples nfeatures Training set

ynumpy array of shape nsamples Target values

Returns

Xnew numpy array of shape nsamples nfeaturesnew Transformed array

getparams selfdeepTrue

Get parameters for this estimator

Parameters

deep boolean optional If True will return the parameters for this estimator and contained subobjects that are estimators

Returns

params mapping of string to any Parameter names mapped to their values

inversetransform selfX

Scale back the data to the original representation

Parameters

Xarraylike The data used to scale along the specified axis

setparams selfparams

Set the parameters of this estimator

The method works on simple estimators as well as on nested objects such as pipelines The latter have parameters of the form componentparameter so that it's possible to update each component of a nested object

Returns

self

transform selfX

Center and scale the data

Parameters

Xarraylike sparse matrix The data used to scale along the specified axis

Examples using sklearnpreprocessingRobustScaler

•Compare the effect of different scalers on data with outliers

63417sklearnpreprocessing StandardScaler

classssklearnpreprocessing StandardScaler copyTrue withmeanTrue withstdTrue

Standardize features by removing the mean and scaling to unit variance

634sklearnpreprocessing Preprocessing and Normalization 2273

scikitlearn user guide Release 0213

The standard score of a sample x_i is calculated as

$$z = \frac{x_i - \mu}{\sigma}$$

where μ is the mean of the training samples or zero if `withmean=False` and σ is the standard deviation of the training samples or one if `withstd=False`

Centering and scaling happen independently on each feature by computing the relevant statistics on the samples in the training set. Mean and standard deviation are then stored to be used on later data using the `transform` method.

Standardization of a dataset is a common requirement for many machine learning estimators; they might behave badly if the individual features do not more or less look like standard normally distributed data (e.g. Gaussian) with 0 mean and unit variance.

For instance, many elements used in the objective function of a learning algorithm (such as the RBF (Radial Basis Function) kernel of Support Vector Machines or the L1 and L2 regularizers of linear models) assume that all features are centered around 0 and have variance in the same order. If a feature has a variance that is orders of magnitude larger than others, it might dominate the objective function and make the estimator unable to learn from other features correctly as expected.

This scaler can also be applied to sparse CSR (Compressed Sparse Row) or CSC matrices by passing `withmean=False` to avoid breaking the sparsity structure of the data.

Read more in the User Guide

Parameters

`copy` boolean, optional, default: True. If False, try to avoid a copy and do inplace scaling instead. This is not guaranteed to always work inplace (e.g. if the data is not a NumPy array or SciPy sparse CSR (Compressed Sparse Row) matrix, a copy may still be returned).
`withmean` boolean, True by default. If True, center the data before scaling. This does not work and will raise an exception when attempted on sparse matrices because centering them entails building a dense matrix which in common use cases is likely to be too large to fit in memory.

`withstd` boolean, True by default. If True, scale the data to unit variance or equivalently unit standard deviation.

Attributes

`scale` ndarray or None, shape (n_features,). Per feature relative scaling of the data. This is calculated using `np.sqrt(var)`. Equal to None when `withstd=False`.

New in version 0.17: `scale`

`mean` ndarray or None, shape (n_features,). The mean value for each feature in the training set. Equal to None when `withmean=False`.

`var` ndarray or None, shape (n_features,). The variance for each feature in the training set. Used to compute `scale`. Equal to None when `withstd=False`.

`nsamplesseen` int or array, shape (n_features,). The number of samples processed by the estimator for each feature. If there are not missing samples, the `nsamplesseen` will be an integer; otherwise, it will be an array. Will be reset on new calls to `fit` but increments across `partial_fit` calls.

See also

`scale`: Equivalent function without the estimator API (Application Programming Interface).
2274 Chapter 6: API (Application Programming Interface) Reference

scikitlearn user guide Release 0213

sklearn.decomposition.PCA Further removes the linear correlation across features with 'whiten=True'

Notes

NaNs are treated as missing values disregarded in fit and maintained in transform

We use a biased estimator for the standard deviation equivalent to numpy.std(x, ddof=0). Note that the choice of ddof is unlikely to affect model performance

For a comparison of the different scalers, transformers and normalizers see examples/preprocessing/plot_all_scaling.py

Examples

```
from sklearn.preprocessing import StandardScaler
data = 0 0 0 0 1 1 1 1
scaler = StandardScaler()
print(scaler.fit(data))
StandardScaler(copy=True, with_mean=True, with_std=True)
print(scaler.mean_)
0.5 0.5
print(scaler.transform(data))
1 1
1 1
1 1
1 1
print(scaler.transform(2 * data))
3 3

2278 Chapter 6 API (Application Programming Interface) Reference

scikitlearn user guide Release 0213

Several regression and binary classification algorithms are available in scikitlearn A simple way to extend these algorithms to the multiclass classification case is to use the socalled onevsall scheme This function makes it possible to compute this transformation for a fixed set of class labels known ahead of time

Parameters
yarraylike Sequence of integer labels or multilabel data to encode
classes arraylike of shape nclasses Uniquely holds the label for each class
neglabel int default 0 Value with which negative labels must be encoded
poslabel int default 1 Value with which positive labels must be encoded
sparseoutput boolean default False Set to true if output binary array is desired in CSR (Compressed Sparse Row)
sparse format

Returns
Ynumpy array or CSR (Compressed Sparse Row) matrix of shape nsamples nclasses Shape will be nsamples 1 for binary problems

63421sklearnpreprocessing maxabsscale

sklearnpreprocessing maxabsscale Xaxis0 copyTrue

Scale each feature to the 1 1 range without breaking the sparsity

This estimator scales each feature individually such that the maximal absolute value of each feature in the training set will be 10

This scaler can also be applied to sparse CSR (Compressed Sparse Row) or CSC matrices

Parameters

Xarraylike shape nsamples nfeatures The data

axis int 0 by default axis used to scale along If 0 independently scale each feature other wise if 1 scale each sample

copy boolean optional default is True Set to False to perform inplace scaling and avoid a copy if the input is already a numpy array

See also

MaxAbsScaler Performs scaling to the 1 1 range using the“Transformer“ API (Application Programming Interface) eg as part of a preprocessingpipelinePipeline

Notes

NaNs are treated as missing values disregarded to compute the statistics and maintained during the data transformation

For a comparison of the different scalers transformers and normalizers see examplespreprocessingplotallscalingpy

63422sklearnpreprocessing minmaxscale

sklearnpreprocessing minmaxscale Xfeaturerange0 1axis0 copyTrue

Transforms features by scaling each feature to a given range

This estimator scales and translates each feature individually such that it is in the given range on the training set ie between zero and one

The transformation is given by when axis0

$$X_{std} = \frac{X - X_{min,axis0}}{X_{max,axis0} - X_{min,axis0}}$$

Xscaled Xstd max min min

where min max featurerange

The transformation is calculated as when axis0

$$X_{scaled} = \frac{scale \cdot X - min}{X_{max,axis0} - X_{min,axis0}}$$

where scale max min Xmaxaxis0 Xminaxis0

This transformation is often used as an alternative to zero mean unit variance scaling

•Compare the effect of different scalers on data with outliers

63423sklearnpreprocessing normalize

sklearnpreprocessing normalize Xnorm‘l2’ axis1 copyTrue returnnormFalse

Scale input vectors individually to unit norm vector length

Read more in the User Guide

Parameters

Xarraylike sparse matrix shape nsamples nfeatures The data to normalize element

by element scipysparse matrices should be in CSR (Compressed Sparse Row) format to avoid an unnecessary copy

norm ‘l1’ ‘l2’ or ‘max’ optional ‘l2’ by default The norm to use to normalize each non

zero sample or each nonzero feature if axis is 0

axis 0 or 1 optional 1 by default axis used to normalize the data along If 1 independently

normalize each sample otherwise if 0 normalize each feature

copy boolean optional default True set to False to perform inplace row normalization and

avoid a copy if the input is already a numpy array or a scipysparse CSR (Compressed Sparse Row) matrix and if axis
is 1

returnnorm boolean default False whether to return the computed norms

Returns

Xarraylike sparse matrix shape nsamples nfeatures Normalized input X

norms array shape nsamples if axis1 else nfeatures An array of norms along given

axis for X When X is sparse a NotImplementedError will be raised for norm ‘l1’ or ‘l2’

63424sklearnpreprocessing quantiletransform

sklearnpreprocessing quantiletransform X axis0 nquantiles1000 out

putdistribution'uniform' ig

noreimplicitzerosFalse subsample100000

randomstateNone copy'warn'

Transform features using quantiles information

This method transforms the features to follow a uniform or a normal distribution Therefore for a given feature this transformation tends to spread out the most frequent values It also reduces the impact of marginal outliers this is therefore a robust preprocessing scheme

The transformation is applied on each feature independently First an estimate of the cumulative distribution function of a feature is used to map the original values to a uniform distribution The obtained values are then mapped to the desired output distribution using the associated quantile function Features values of newunseen data that fall below or above the fitted range will be mapped to the bounds of the output distribution Note that this transform is nonlinear It may distort linear correlations between variables measured at the same scale but renders variables measured at different scales more directly comparable

Read more in the User Guide

Parameters

Xarraylike sparse matrix The data to transform

axis int default0 Axis used to compute the means and standard deviations along If 0

transform each feature otherwise if 1 transform each sample

nquantiles int optional default1000 or nsamples Number of quantiles to be computed

It corresponds to the number of landmarks used to discretize the cumulative distribution

function If nquantiles is larger than the number of samples nquantiles is set to the

number of samples as a larger number of quantiles does not give a better approximation of

the cumulative distribution function estimator

outputdistribution str optional default'uniform' Marginal distribution for the trans

formed data The choices are 'uniform' default or 'normal'

ignoreimplicitzeros bool optional defaultFalse Only applies to sparse matrices If True

the sparse entries of the matrix are discarded to compute the quantile statistics If False

these entries are treated as zeros

subsample int optional default1e5 Maximum number of samples used to estimate the

quantiles for computational efficiency Note that the subsampling procedure may differ

for valueidentical sparse and dense matrices

randomstate int RandomState instance or None optional defaultNone If int ran

domstate is the seed used by the random number generator If RandomState instance

randomstate is the random number generator If None the random number generator is

the RandomState instance used by nprandom Note that this is used by subsampling and

smoothing noise

copy boolean optional default"warn" Set to False to perform inplace transformation and

avoid a copy if the input is already a numpy array If True a copy of Xis transformed

leaving the original Xunchanged

scikitlearn user guide Release 0213

Deprecated since version 021 The default value of parameter copy will be changed from False to True in 023 The current default of False is being changed to make it more consistent with the default copy values of other functions in sklearnpreprocessing data Furthermore the current default of False may have unexpected side effects by modifying the value of Xinplace

Returns

Xtndarray or sparse matrix shape nsamples nfeatures The transformed data

63427 `sklearn.preprocessing.PowerTransformer`

`sklearn.preprocessing.PowerTransformer` `X.method='warn'` `standardize=True` `copy=True`

Power transforms are a family of parametric monotonic transformations that are applied to make data more Gaussian-like. This is useful for modeling issues related to heteroscedasticity, nonconstant variance or other situations where normality is desired.

Currently `PowerTransformer` supports the Box-Cox transform and the Yeo-Johnson transform. The optimal parameter for stabilizing variance and minimizing skewness is estimated through maximum likelihood. Box-Cox requires input data to be strictly positive while Yeo-Johnson supports both positive or negative data. By default, zero mean unit variance normalization is applied to the transformed data.

Read more in the User Guide

Parameters

`X`: array-like shape (n_samples, n_features). The data to be transformed using a power transformation.

`method`: str. The power transform method. Available methods are:

- ‘yeojohnson’: 1 works with positive and negative values
- ‘boxcox’: 2 only works with strictly positive values

The default method will be changed from ‘boxcox’ to ‘yeojohnson’ in version 0.23. To suppress the FutureWarning, explicitly set the parameter.

Random Projection transformers

Random Projections are a simple and computationally efficient way to reduce the dimensionality of the data by trading
a controlled amount of accuracy as additional variance for faster processing times and smaller model sizes

The dimensions and distribution of Random Projections matrices are controlled so as to preserve the pairwise distances
between any two samples of the dataset

The main theoretical result behind the efficiency of random projection is the JohnsonLindenstrauss lemma quoting
Wikipedia

2286 Chapter 6 API (Application Programming Interface) Reference

scikitlearn user guide Release 0213

In mathematics the JohnsonLindenstrauss lemma is a result concerning lowdistortion embeddings of points from highdimensional into lowdimensional Euclidean space The lemma states that a small set of points in a highdimensional space can be embedded into a space of much lower dimension in such a way that distances between the points are nearly preserved The map used for the embedding is at least Lipschitz and can even be taken to be an orthogonal projection

User guide See the Random Projection section for further details

classssklearnrandomprojection GaussianRandomProjection ncomponents'auto'

eps01 ran

domstateNone

Reduce dimensionality through Gaussian random projection

The components of the random matrix are drawn from $N(0, 1/ncomponents)$

Read more in the User Guide

Parameters

ncomponents int or 'auto' optional default 'auto' Dimensionality of the target projection space

ncomponents can be automatically adjusted according to the number of samples in the dataset and the bound given by the JohnsonLindenstrauss lemma In that case the quality of the embedding is controlled by the eps parameter

It should be noted that JohnsonLindenstrauss lemma can yield very conservative estimated of the required number of components as it makes no assumption on the structure of the dataset

eps strictly positive float optional default01 Parameter to control the quality of the embedding according to the JohnsonLindenstrauss lemma when ncomponents is set to 'auto'

Smaller values lead to better embedding and higher number of dimensions ncomponents in the target projection space

randomstate int RandomState instance or None optional defaultNone Control the pseudo random number generator used to generate the matrix at fit time If int randomstate is the seed used by the random number generator If RandomState instance randomstate is the random number generator If None the random number generator is the RandomState instance used by nprandom

Attributes

transform(self, X) Project the data by using matrix product with the random matrix
init(self, n_components='auto', eps=0.1, random_state=None)
fit(self, X, y=None)
```

Generate a sparse random projection matrix

Parameters

X: Numpy array or scipy.sparse of shape (n_samples, n_features). Training set only the shape is used to find optimal random matrix dimensions based on the theory referenced in the afore mentioned papers

y: ignored

Returns

self

fit_transform(self, X, y=None, fit_params=None)

Fit to data then transform it

Fits transformer to X and y with optional parameters fit_params and returns a transformed version of X

Parameters

X: Numpy array of shape (n_samples, n_features). Training set

y: numpy array of shape (n_samples). Target values

Returns

X_new: numpy array of shape (n_samples, n_features_new). Transformed array

get_params(self, deep=True)

Get parameters for this estimator

Parameters

deep: boolean, optional. If True will return the parameters for this estimator and contained subobjects that are estimators

scikitlearn user guide Release 0213

Returns

params mapping of string to any Parameter names mapped to their values

setparams selfparams

Set the parameters of this estimator

The method works on simple estimators as well as on nested objects such as pipelines The latter have parameters of the form componentparameter so that it's possible to update each component of a nested object

Returns

self

transform selfX

Project the data by using matrix product with the random matrix

Parameters

Xnumpy array or scipysparse of shape nsamples nfeatures The input data to project into a smaller dimensional space

Returns

Xnew numpy array or scipy sparse of shape nsamples ncomponents Projected array

6352sklearnrandomprojection SparseRandomProjection

classsklearnrandomprojection SparseRandomProjection ncomponents'auto'

density'auto' eps01

denseoutputFalse ran

domstateNone

Reduce dimensionality through sparse random projection

Sparse random matrix is an alternative to dense random projection matrix that guarantees similar embedding quality while being much more memory efficient and allowing faster computation of the projected data

If we notes 1 density the components of the random matrix are drawn from

- sqrts sqrtncomponents with probability 1 2s
- 0 with probability 1 1 s
- sqrts sqrtncomponents with probability 1 2s

Read more in the User Guide

Parameters

ncomponents int or 'auto' optional default 'auto' Dimensionality of the target projection space

ncomponents can be automatically adjusted according to the number of samples in the dataset and the bound given by the JohnsonLindenstrauss lemma In that case the quality of the embedding is controlled by the eps parameter

It should be noted that JohnsonLindenstrauss lemma can yield very conservative estimated of the required number of components as it makes no assumption on the structure of the dataset

density float in range 0 1 optional default'auto' Ratio of nonzero component in the random projection matrix

635sklearnrandomprojection Random projection 2289

scikitlearn user guide Release 0213

If density 'auto' the value is set to the minimum density as recommended by Ping Li et al 1 sqrt(n)features

Use density 1 30 if you want to reproduce the results from Achlioptas 2001

eps strictly positive float optional default0.1 Parameter to control the quality of the embedding according to the JohnsonLindenstrauss lemma when ncomponents is set to 'auto' Smaller values lead to better embedding and higher number of dimensions ncomponents in the target projection space

denseoutput boolean optional defaultFalse If True ensure that the output of the random projection is a dense numpy array even if the input and random projection matrix are both sparse In practice if the number of components is small the number of zero components in the projected data will be very small and it will be more CPU and memory efficient to use a dense representation

If False the projected data uses a sparse representation if the input is sparse randomstate int RandomState instance or None optional defaultNone Control the pseudo random number generator used to generate the matrix at fit time If int randomstate is the seed used by the random number generator If RandomState instance randomstate is the random number generator If None the random number generator is the RandomState instance used by nprandom

Attributes

ncomponent int Concrete number of components computed when ncomponents="auto"

components CSR (Compressed Sparse Row) matrix with shape (ncomponents, nfeatures) Random matrix used for the projection

density float in range [0, 1] Concrete density computed from when density "auto"

- Manifold learning on handwritten digits Locally Linear Embedding Isomap

randomprojection

johnsonlindenstraussmindim Find a ‘safe’ number of components to randomly project to

6353sklearnrandomprojection johnsonlindenstraussmindim

sklearnrandomprojection johnsonlindenstraussmindim nsamples eps01

Find a ‘safe’ number of components to randomly project to

The distortion introduced by a random projection ponly changes the distance between two points by a factor 1
eps in an euclidean space with good probability The projection pis an epseembedding as defined by

1 eps u v2 pu pv2 1 eps u v2

Where u and v are any rows taken from a dataset of shape nsamples nfeatures eps is in 0 1 and p is a
projection by a random Gaussian N0 1 matrix with shape ncomponents nfeatures or a sparse Achlioptas
matrix

The minimum number of components to guarantee the epseembedding is given by

ncomponents 4 lognsamples eps2 2 eps3 3

Note that the number of dimensions is independent of the original number of features but instead depends on
the size of the dataset the larger the dataset the higher is the minimal dimensionality of an epseembedding

Read more in the User Guide

Parameters

nsamples int or numpy array of int greater than 0 Number of samples If an array is given
it will compute a safe number of components arraywise

eps float or numpy array of float in 01 optional default01 Maximum distortion rate as
defined by the JohnsonLindenstrauss lemma If an array is given it will compute a safe
number of components arraywise

Returns

ncomponents int or numpy array of int The minimal number of components to guarantee
with good probability an epseembedding with nsamples

```

LabelSpreading

Methods

`fit(self, X, y)` Fit a semisupervised label propagation model based on `X` and `y`.

`get_params(self, deep=True)` Get parameters for this estimator.

`predict(self, X)` Performs inductive inference across the model.

`predict_proba(self, X)` Predict probability for each possible outcome.

`score(self, X, y, sample_weight)` Returns the mean accuracy on the given test data and labels.

`set_params(self, **params)` Set the parameters of this estimator.

`__init__(self, kernel='rbf', gamma=0.2, n_neighbors=7, alpha=0.2, max_iter=30, tol=0.001, n_jobs=None)`

`fit(self, X, y)` Fit a semisupervised label propagation model based on `X` and `y`. All the input data is provided as matrix `X` (labeled and unlabeled) and corresponding label matrix `y` with a dedicated marker value for unlabeled samples.

Parameters

- `X`: array-like shape `(n_samples, n_features)`. A `n_samples` by `n_features` matrix will be created from this.
- `y`: array-like shape `(n_samples,)`. Labeled samples and unlabeled points are marked as 1. All unlabeled samples will be transductively assigned labels.

Returns

`self`: returns an instance of `LabelSpreading`.

`get_params(self, deep=True)` Get parameters for this estimator.

Parameters

- `deep`: boolean, optional. If `True` will return the parameters for this estimator and contained subobjects that are estimators.

Returns

`params`: mapping of string to any Parameter names mapped to their values.

scikitlearn user guide Release 0213

predictselfX

Performs inductive inference across the model

Parameters

Xarraylike shape nsamples nfeatures

Returns

yarraylike shape nsamples Predictions for input data

predictproba selfX

Predict probability for each possible outcome

Compute the probability estimates for each single sample in X and each possible outcome seen during training categorical distribution

Parameters

Xarraylike shape nsamples nfeatures

Returns

probabilities array shape nsamples nclasses Normalized probability distributions

across class labels

scoreselfXysampleweightNone

Returns the mean accuracy on the given test data and labels

In multilabel classification this is the subset accuracy which is a harsh metric since you require for each sample that each label set be correctly predicted

Parameters

Xarraylike shape nsamples nfeatures Test samples

yarraylike shape nsamples or nsamples noutputs True labels for X

sampleweight arraylike shape nsamples optional Sample weights

Returns

score float Mean accuracy of selfpredictX wrt y

setparams selfparams

Set the parameters of this estimator

The method works on simple estimators as well as on nested objects such as pipelines The latter have parameters of the form componentparameter so that it's possible to update each component of a nested object

Returns

self

class sklearnsvm LinearSVC penalty' l2' loss'squaredhinge' dualTrue tol00001

C10 multiclass'ovr' fitinterceptTrue interceptscaling1

class weightNone verbose0 randomstateNone maxiter1000

Linear Support Vector Classification

Similar to SVC (Support Vector Classification) with parameter kernel'linear' but implemented in terms of liblinear rather than libsvm so it has more flexibility in the choice of penalties and loss functions and should scale better to large numbers of samples

This class supports both dense and sparse input and the multiclass support is handled according to a one-vs-the-rest scheme

Read more in the User Guide

Parameters

penalty string 'l1' or 'l2' default'l2' Specifies the norm used in the penalization The 'l2' penalty is the standard used in SVC (Support Vector Classification) The 'l1' leads to coef vectors that are sparse

loss string 'hinge' or 'squaredhinge' default'squaredhinge' Specifies the loss function 'hinge' is the standard SVM (Support Vector Machine) loss used eg by the SVC (Support Vector Classification) class while 'squaredhinge' is the square of the hinge loss

dual bool defaultTrue Select the algorithm to either solve the dual or primal optimization problem Prefer dualFalse when n samples n features

tol float optional default1e4 Tolerance for stopping criteria

C float optional default10 Penalty parameter C of the error term

multiclass string 'ovr' or 'crammersinger' default'ovr' Determines the multiclass strategy if y contains more than two classes ovr trains n classes one-vs-rest classifiers while crammersinger optimizes a joint objective over all classes While crammersinger is interesting from a theoretical perspective as it is consistent it is seldom used in practice as it rarely leads to better accuracy and is more expensive to compute If crammersinger is chosen the options loss penalty and dual will be ignored

fitintercept boolean optional defaultTrue Whether to calculate the intercept for this model If set to false no intercept will be used in calculations ie data is expected to be centered

637sklearnsvm Support Vector Machines 2299

scikitlearn user guide Release 0213

be already centered

interceptscaling float optional default1 When selffitintercept is True instance vector

x becomesx selfinterceptscaling ie a “synthetic” feature with constant

value equals to interceptscaling is appended to the instance vector The intercept becomes

interceptscaling synthetic feature weight Note the synthetic feature weight is subject to

l1l2 regularization as all other features To lessen the effect of regularization on synthetic

feature weight and therefore on the intercept interceptscaling has to be increased

classweight dict ‘balanced’ optional Set the parameter C of class i to

classweighti Cfor SVC (Support Vector Classification) If not given all classes are supposed to have weight

one The “balanced” mode uses the values of y to automatically adjust weights inversely

proportional to class frequencies in the input data as nsamples nclasses

npbincounty

verbose int default0 Enable verbose output Note that this setting takes advantage of a per
process runtime setting in liblinear that if enabled may not work properly in a multithreaded
context

randomstate int RandomState instance or None optional defaultNone The seed of the

pseudo random number generator to use when shuffling the data for the dual coordi

nate descent if dualTrue WhendualFalse the underlying implementation of

LinearSVC is not random and randomstate has no effect on the results If int ran

domstate is the seed used by the random number generator If RandomState instance ran

domstate is the random number generator If None the random number generator is the

RandomState instance used by nprandom

maxiter int default1000 The maximum number of iterations to be run

Attributes

coef array shape nfeatures if nclasses 2 else nclasses nfeatures Weights as

signed to the features coefficients in the primal problem This is only available in the case
of a linear kernel

coef is a readonly property derived from rawcoef that follows the internal memory

layout of liblinear

intercept array shape 1 if nclasses 2 else nclasses Constants in decision function

See also

SVC (Support Vector Classification) Implementation of Support Vector Machine classifier using libsvm the kernel can be nonlinear but its

SMO algorithm does not scale to large number of samples as LinearSVC does Furthermore SVC (Support Vector Classification) multi

class mode is implemented using one vs one scheme while LinearSVC uses one vs the rest It is possible to

implement one vs the rest with SVC (Support Vector Classification) by using the sklearnmulticlassOneVsRestClassifier

wrapper Finally SVC (Support Vector Classification) can fit dense data without memory copy if the input is Ccontiguous Sparse data

will still incur memory copy though

sklearnlinearmodelSGDClassifier SGDClassifier can optimize the same cost function as Lin

earSVC by adjusting the penalty and loss parameters In addition it requires less memory allows incre

mental online learning and implements various loss functions and regularization regimes

Notes

The underlying C implementation uses a random number generator to select features when fitting the model

It is thus not uncommon to have slightly different results for the same input data If that happens try with a

smallertol parameter

2300 Chapter 6 API (Application Programming Interface) Reference

scikitlearn user guide Release 0213

The underlying implementation liblinear uses a sparse internal representation for the data that will incur a memory copy

Predict output may not match that of standalone liblinear in certain cases See differences from liblinear in the narrative documentation

637sklearnsvm Support Vector Machines 2301

scikitlearn user guide Release 0213

array shapensamples if nclasses > 2 else nsamples nclasses Confidence scores per sample class combination In the binary case confidence score for selfclasses1 where 0 means this class would be predicted

densifyself

Convert coefficient matrix to dense array format

Converts the coef member back to a numpyndarray This is the default format of coef and is required for fitting so calling this method is only required on models that have previously been sparsified otherwise it is a noop

Returns

self estimator

fitselfXysampleweightNone

Fit the model according to the given training data

Parameters

Xarraylike sparse matrix shape nsamples nfeatures Training vector where nsamples is the number of samples and nfeatures is the number of features

yarraylike shape nsamples Target vector relative to X

sampleweight arraylike shape nsamples optional Array of weights that are assigned to individual samples If not provided then each sample is given unit weight

Returns

self object

getparams selfdeepTrue

Get parameters for this estimator

Parameters

deep boolean optional If True will return the parameters for this estimator and contained subobjects that are estimators

Returns

params mapping of string to any Parameter names mapped to their values

predictselfX

Predict class labels for samples in X

Parameters

Xarraylike or sparse matrix shape nsamples nfeatures Samples

Returns

Carray shape nsamples Predicted class label per sample

scoreselfXysampleweightNone

Returns the mean accuracy on the given test data and labels

In multilabel classification this is the subset accuracy which is a harsh metric since you require for each sample that each label set be correctly predicted

Parameters

Xarraylike shape nsamples nfeatures Test samples

yarraylike shape nsamples or nsamples noutputs True labels for X

2302 Chapter 6 API (Application Programming Interface) Reference

scikitlearn user guide Release 0213

sampleweight arraylike shape nsamples optional Sample weights

Returns

score float Mean accuracy of selfpredictX wrt y

setparams selfparams

Set the parameters of this estimator

The method works on simple estimators as well as on nested objects such as pipelines The latter have

parameters of the form componentparameter so that it's possible to update each component

of a nested object

Returns

self

sparsify self

Convert coefficient matrix to sparse format

Converts the coef member to a scipysparse matrix which for L1regularized models can be much more

memory and storageefficient than the usual numpyndarray representation

Theintercept member is not converted

Returns

self estimator

Notes

For nonsparse models ie when there are not many zeros in coef this may actually increase memory

usage so use this method with care A rule of thumb is that the number of zero elements which can be

computed with coef 0sum must be more than 50 for this to provide significant benefits

After calling this method further fitting with the partialfit method if any will not work until you call

densify

Examples using sklearnsvmLinearSVC

- Explicit feature map approximation for RBF (Radial Basis Function) kernels

Linear Support Vector Regression

Similar to SVR (Support Vector Regression) with parameter kernel'linear' but implemented in terms of liblinear rather than libsvm so it has more flexibility in the choice of penalties and loss functions and should scale better to large numbers of samples

This class supports both dense and sparse input

Read more in the User Guide

Parameters

epsilon float optional default00 Epsilon parameter in the epsiloninsensitive loss function

Note that the value of this parameter depends on the scale of the target variable y If unsure

setepsilon0

tolfloat optional default1e4 Tolerance for stopping criteria

Cfloat optional default10 Penalty parameter C of the error term The penalty is a squared

L2 penalty The bigger this parameter the less regularization is used

loss string optional default'epsiloninsensitive' Specifies the loss function The epsilon

insensitive loss standard SVR (Support Vector Regression) is the L1 loss while the squared epsiloninsensitive loss

'squaredepsiloninsensitive' is the L2 loss

fitintercept boolean optional defaultTrue Whether to calculate the intercept for this

model If set to false no intercept will be used in calculations ie data is expected to be already centered

interceptscaling float optional default1 When selffitintercept is True instance vec

tor x becomes x selfinterceptscaling ie a "synthetic" feature with constant value

equals to interceptscaling is appended to the instance vector The intercept becomes in

terceptscaling synthetic feature weight Note the synthetic feature weight is subject to

L1L2 regularization as all other features To lessen the effect of regularization on synthetic

feature weight and therefore on the intercept interceptscaling has to be increased

dual bool defaultTrue Select the algorithm to either solve the dual or primal optimization

problem Prefer dualFalse when nsamples nfeatures

verbose int default0 Enable verbose output Note that this setting takes advantage of a per process runtime setting in liblinear that if enabled may not work properly in a multithreaded context

randomstate int RandomState instance or None optional defaultNone The seed of the

pseudo random number generator to use when shuffling the data If int randomstate is

the seed used by the random number generator If RandomState instance randomstate is

the random number generator If None the random number generator is the RandomState

instance used by nprandom

maxiter int default1000 The maximum number of iterations to be run

Attributes

coef array shape nfeatures if nclasses 2 else nclasses nfeatures Weights as

signed to the features coefficients in the primal problem This is only available in the case of a linear kernel

Methods

fitself X y sampleweight Fit the model according to the given training data

getparams self deep Get parameters for this estimator

predict self X Predict using the linear model

score self X y sampleweight Returns the coefficient of determination R2 of the prediction

setparams self params Set the parameters of this estimator

init selfepsilon00 tol00001 C10 loss'epsiloninsensitive' fitinterceptTrue interceptscaling10 dualTrue verbose0 randomstateNone maxiter1000

fitselfXysampleweightNone

Fit the model according to the given training data

Parameters

Xarraylike sparse matrix shape nsamples nfeatures Training vector where

nsamples in the number of samples and nfeatures is the number of features

yarraylike shape nsamples Target vector relative to X

637sklearnsvm Support Vector Machines 2305

scikitlearn user guide Release 0213

sampleweight arraylike shape nsamples optional Array of weights that are as signed to individual samples If not provided then each sample is given unit weight

Returns

self object

getparams selfdeepTrue

Get parameters for this estimator

Parameters

deep boolean optional If True will return the parameters for this estimator and contained subobjects that are estimators

Returns

params mapping of string to any Parameter names mapped to their values

predictselfX

Predict using the linear model

Parameters

Xarraylike or sparse matrix shape nsamples nfeatures Samples

Returns

Carray shape nsamples Returns predicted values

scoreselfXysampleweightNone

Returns the coefficient of determination R2 of the prediction

The coefficient R2 is defined as $1 - \frac{u}{v}$ where u is the residual sum of squares $y_{true} - y_{pred}$

$2sum$ and v is the total sum of squares $y_{true} - y_{truemean}$ $2sum$ The best possible score

is 10 and it can be negative because the model can be arbitrarily worse A constant model that always

predicts the expected value of y disregarding the input features would get a R2 score of 00

Parameters

Xarraylike shape nsamples nfeatures Test samples For some estimators this may

be a precomputed kernel matrix instead shape nsamples nsamplesfitted where

nsamplesfitted is the number of samples used in the fitting for the estimator

yarraylike shape nsamples or nsamples noutputs True values for X

sampleweight arraylike shape nsamples optional Sample weights

Returns

score float R2 of selfpredictX wrt y

Notes

The R2 score used when calling score on a regressor will use multioutputuniformaverage

from version 023 to keep consistent with metricsr2score This will influence the score

method of all the multioutput regressors except for multioutputMultiOutputRegressor

To specify the default value manually and avoid the warning please either call metricsr2score

directly or make a custom scorer with metricsmakescorer the builtin scorer r2 uses

multioutputuniformaverage

2306 Chapter 6 API (Application Programming Interface) Reference

scikitlearn user guide Release 0213

setparams selfparams

Set the parameters of this estimator

The method works on simple estimators as well as on nested objects such as pipelines The latter have parameters of the form componentparameter so that it's possible to update each component of a nested object

Returns

self

sionfunctionshape'ovr' randomstateNone

NuSupport Vector Classification

Similar to SVC (Support Vector Classification) but uses a parameter to control the number of support vectors

The implementation is based on libsvm

Read more in the User Guide

Parameters

nu float optional default05 An upper bound on the fraction of training errors and a lower

bound of the fraction of support vectors Should be in the interval 0 1

kernel string optional default'rbf' Specifies the kernel type to be used in the algorithm

It must be one of 'linear' 'poly' 'rbf' 'sigmoid' 'precomputed' or a callable If none is

given 'rbf' will be used If a callable is given it is used to precompute the kernel matrix

degree int optional default3 Degree of the polynomial kernel function 'poly' Ignored

by all other kernels

gamma float optional default'auto' Kernel coefficient for 'rbf' 'poly' and 'sigmoid'

Current default is 'auto' which uses 1 / nfeatures if gammascale is passed then it

uses 1 / nfeatures Xvar as value of gamma The current default of gamma 'auto'

will change to 'scale' in version 022 'autodeprecated' a deprecated version of 'auto' is

used as a default indicating that no explicit value of gamma was passed

coef0 float optional default00 Independent term in kernel function It is only significant

in 'poly' and 'sigmoid'

shrinking boolean optional defaultTrue Whether to use the shrinking heuristic

probability boolean optional defaultFalse Whether to enable probability estimates This

must be enabled prior to calling fit and will slow down that method

tol float optional default1e3 Tolerance for stopping criterion

cachesize float optional Specify the size of the kernel cache in MB

classweight dict 'balanced' optional Set the parameter C of class i to classweightiC

for SVC (Support Vector Classification) If not given all classes are supposed to have weight one The "balanced" mode

uses the values of y to automatically adjust weights inversely proportional to class frequen

cies asnsamples nclasses npbincounty

637sklearnsvm Support Vector Machines 2307

scikitlearn user guide Release 0213

verbose bool default False Enable verbose output Note that this setting takes advantage of a perprocess runtime setting in libsvm that if enabled may not work properly in a multithreaded context

maxiter int optional default1 Hard limit on iterations within solver or 1 for no limit

decisionfunctionshape 'ovo' 'ovr' default'ovr' Whether to return a onevsrest 'ovr'

decision function of shape nsamples nclasses as all other classifiers or the original onevsone 'ovo' decision function of libsvm which has shape nsamples nclasses

nclasses 1 2

Changed in version 019 decisionfunctionshape is 'ovr' by default

New in version 017 decisionfunctionshape'ovr' is recommended

Changed in version 017 Deprecated decisionfunctionshape'ovo' and None

randomstate int RandomState instance or None optional defaultNone The seed of the pseudo random number generator used when shuffling the data for probability estimates

If int randomstate is the seed used by the random number generator If RandomState instance randomstate is the random number generator If None the random number generator is the RandomState instance used by nprandom

Attributes

support arraylike shape nSV Indices of support vectors

supportvectors arraylike shape nSV nfeatures Support vectors

nsupport arraylike dtypeint32 shape nclass Number of support vectors for each

class

dualcoef array shape nclass1 nSV Coefficients of the support vector in the decision

function For multiclass coefficient for all 1vs1 classifiers The layout of the coefficients in the multiclass case is somewhat nontrivial See the section about multiclass classification in the SVM (Support Vector Machine) section of the User Guide for details

coef array shape nclass nclass1 2 nfeatures Weights assigned to the features

coefficients in the primal problem This is only available in the case of a linear kernel

coef is readonly property derived from dualcoef andsupportvectors

ingTrue probabilityFalse tol0001 cachesize200 classweightNone ver

boseFalse maxiter1 decisionfunctionshape'ovr' randomstateNone

decisionfunction selfX

Evaluates the decision function for the samples in X

Parameters

Xarraylike shape nsamples nfeatures

Returns

Xarraylike shape nsamples nclasses nclasses1 2 Returns the decision func

tion of the sample for each class in the model If decisionfunctionshape'ovr' the shape

is nsamples nclasses

Notes

If decisionfunctionshape'ovo' the function values are proportional to the distance of the samples X to

the separating hyperplane If the exact distances are required divide the function values by the norm of

the weight vector coef See also this question for further details If decisionfunctionshape'ovr'

the decision function is a monotonic transformation of ovo decision function

fitselfXysampleweightNone

Fit the SVM (Support Vector Machine) model according to the given training data

Parameters

Xarraylike sparse matrix shape nsamples nfeatures Training vectors where

nsamples is the number of samples and nfeatures is the number of features For ker

nel"precomputed" the expected shape of X is nsamples nsamples

yarraylike shape nsamples Target values class labels in classification real numbers

in regression

637sklearnsvm Support Vector Machines 2309

scikitlearn user guide Release 0213

sampleweight arraylike shape nsamples Persample weights Rescale C per sample
Higher weights force the classifier to put more emphasis on these points

Returns
self object

Notes
If X and y are not Cordered and contiguous arrays of npfloat64 and X is not a scipysparsecsrmatrix X
andor y may be copied
If X is a dense array then the other methods will not support sparse matrices as input

getparams selfdeepTrue
Get parameters for this estimator

Parameters
deep boolean optional If True will return the parameters for this estimator and contained
subobjects that are estimators

Returns
params mapping of string to any Parameter names mapped to their values

predictselfX
Perform classification on samples in X
For an oneclass model 1 or 1 is returned

Parameters
Xarraylike sparse matrix shape nsamples nfeatures For kernel"precomputed"
the expected shape of X is nsamplestest nsamplestrain

Returns
ypred array shape nsamples Class labels for samples in X

predictlogproba
Compute log probabilities of possible outcomes for samples in X
The model need to have probability information computed at training time fit with attribute
probability set to True

Parameters
Xarraylike shape nsamples nfeatures For kernel"precomputed" the expected
shape of X is nsamplestest nsamplestrain

Returns
Tarraylike shape nsamples nclasses Returns the logprobabilities of the sample for
each class in the model The columns correspond to the classes in sorted order as they
appear in the attribute classes

Notes
The probability model is created using cross validation so the results can be slightly different than those
obtained by predict Also it will produce meaningless results on very small datasets

2310 Chapter 6 API (Application Programming Interface) Reference

scikitlearn user guide Release 0213

predictproba

Compute probabilities of possible outcomes for samples in X

The model need to have probability information computed at training time fit with attribute

probability set to True

Parameters

Xarraylike shape nsamples nfeatures For kernel”precomputed” the expected

shape of X is nsamplestest nsamplestrain

Returns

Tarraylike shape nsamples nclasses Returns the probability of the sample for each

class in the model The columns correspond to the classes in sorted order as they appear

in the attribute classes

Notes

The probability model is created using cross validation so the results can be slightly different than those

obtained by predict Also it will produce meaningless results on very small datasets

scoreselfXysampleweightNone

Returns the mean accuracy on the given test data and labels

In multilabel classification this is the subset accuracy which is a harsh metric since you require for each

sample that each label set be correctly predicted

Parameters

Xarraylike shape nsamples nfeatures Test samples

yarraylike shape nsamples or nsamples noutputs True labels for X

sampleweight arraylike shape nsamples optional Sample weights

Returns

score float Mean accuracy of selfpredictX wrt y

setparams selfparams

Set the parameters of this estimator

The method works on simple estimators as well as on nested objects such as pipelines The latter have

parameters of the form componentparameter so that it’s possible to update each component

of a nested object

Returns

self

decisionfunction selfX

Signed distance to the separating hyperplane

2316 Chapter 6 API (Application Programming Interface) Reference

scikitlearn user guide Release 0213

Signed distance is positive for an inlier and negative for an outlier

Parameters

Xarraylike shape nsamples nfeatures

Returns

dec arraylike shape nsamples Returns the decision function of the samples

fitselfXyNone sampleweightNone params

Detects the soft boundary of the set of samples X

Parameters

Xarraylike sparse matrix shape nsamples nfeatures Set of samples where nsamples is the number of samples and nfeatures is the number of features

sampleweight arraylike shape nsamples Persample weights Rescale C per sample

Higher weights force the classifier to put more emphasis on these points

yIgnored not used present for API (Application Programming Interface) consistency by convention

Returns

self object

Notes

If X is not a Cordered contiguous array it is copied

fitpredict selfXyNone

Performs fit on X and returns labels for X

Returns 1 for outliers and 1 for inliers

Parameters

Xndarray shape nsamples nfeatures Input data

yIgnored not used present for API (Application Programming Interface) consistency by convention

Returns

yndarray shape nsamples 1 for inliers 1 for outliers

getparams selfdeepTrue

Get parameters for this estimator

Parameters

deep boolean optional If True will return the parameters for this estimator and contained subobjects that are estimators

Returns

params mapping of string to any Parameter names mapped to their values

predictselfX

Perform classification on samples in X

For a oneclass model 1 or 1 is returned

Parameters

637sklearnsvm Support Vector Machines 2317

scikitlearn user guide Release 0213

Xarraylike sparse matrix shape nsamples nfeatures For kernel"precomputed"

the expected shape of X is nsamplestest nsamplestrain

Returns

ypred array shape nsamples Class labels for samples in X

scoresamples selfX

Raw scoring function of the samples

Parameters

Xarraylike shape nsamples nfeatures

Returns

Methods

decisionfunction self X Evaluates the decision function for the samples in X
fitself X y sampleweight Fit the SVM (Support Vector Machine) model according to the given training data
getparams self deep Get parameters for this estimator
predict self X Perform classification on samples in X
score self X y sampleweight Returns the mean accuracy on the given test data and labels

setparams self params Set the parameters of this estimator
init selfC10 kernel'rbf' degree3 gamma'autodeprecated' coef000 shrink
ingTrue probabilityFalse tol0001 cachesize200 classweightNone ver
boseFalse maxiter1 decisionfunctionshape'ovr' randomstateNone
decisionfunction selfX

Evaluates the decision function for the samples in X

Parameters

Xarraylike shape nsamples nfeatures

Returns

Xarraylike shape nsamples nclasses nclasses1 2 Returns the decision func
tion of the sample for each class in the model If decisionfunctionshape'ovr' the shape
is nsamples nclasses

Notes

If decisionfunctionshape'ovo' the function values are proportional to the distance of the samples X to
the separating hyperplane If the exact distances are required divide the function values by the norm of
the weight vector coef See also this question for further details If decisionfunctionshape'ovr'
the decision function is a monotonic transformation of ovo decision function

fitselfXysampleweightNone

Fit the SVM (Support Vector Machine) model according to the given training data

Parameters

Xarraylike sparse matrix shape nsamples nfeatures Training vectors where
nsamples is the number of samples and nfeatures is the number of features For ker
nel"precomputed" the expected shape of X is nsamples nsamples
yarraylike shape nsamples Target values class labels in classification real numbers
in regression

sampleweight arraylike shape nsamples Persample weights Rescale C per sample
Higher weights force the classifier to put more emphasis on these points

Returns

self object

Notes

If X and y are not Cordered and contiguous arrays of npfloat64 and X is not a scipyparsesrmatrix X
andor y may be copied

637sklearnsvm Support Vector Machines 2321

scikitlearn user guide Release 0213

If X is a dense array then the other methods will not support sparse matrices as input

getparams selfdeepTrue

Get parameters for this estimator

Parameters

deep boolean optional If True will return the parameters for this estimator and contained

subobjects that are estimators

Returns

params mapping of string to any Parameter names mapped to their values

predictselfX

Perform classification on samples in X

For an oneclass model 1 or 1 is returned

Parameters

Xarraylike sparse matrix shape nsamples nfeatures For kernel"precomputed"

the expected shape of X is nsamplestest nsamplestrain

Returns

ypred array shape nsamples Class labels for samples in X

predictlogproba

Compute log probabilities of possible outcomes for samples in X

The model need to have probability information computed at training time fit with attribute

probability set to True

Parameters

Xarraylike shape nsamples nfeatures For kernel"precomputed" the expected

shape of X is nsamplestest nsamplestrain

Returns

Tarraylike shape nsamples nclasses Returns the logprobabilities of the sample for

each class in the model The columns correspond to the classes in sorted order as they

appear in the attribute classes

Notes

The probability model is created using cross validation so the results can be slightly different than those

obtained by predict Also it will produce meaningless results on very small datasets

predictproba

Compute probabilities of possible outcomes for samples in X

The model need to have probability information computed at training time fit with attribute

probability set to True

Parameters

Xarraylike shape nsamples nfeatures For kernel"precomputed" the expected

shape of X is nsamplestest nsamplestrain

Returns

2322 Chapter 6 API (Application Programming Interface) Reference

scikitlearn user guide Release 0213

Tarraylike shape nsamples nclasses Returns the probability of the sample for each class in the model The columns correspond to the classes in sorted order as they appear in the attribute classes

Notes

The probability model is created using cross validation so the results can be slightly different than those obtained by predict Also it will produce meaningless results on very small datasets

scoreselfXysampleweightNone

Returns the mean accuracy on the given test data and labels

In multilabel classification this is the subset accuracy which is a harsh metric since you require for each sample that each label set be correctly predicted

Parameters

Xarraylike shape nsamples nfeatures Test samples

yarraylike shape nsamples or nsamples noutputs True labels for X

sampleweight arraylike shape nsamples optional Sample weights

Returns

score float Mean accuracy of selfpredictX wrt y

setparams selfparams

Set the parameters of this estimator

The method works on simple estimators as well as on nested objects such as pipelines The latter have parameters of the form componentparameter so that it's possible to update each component of a nested object

Returns

self

Examples using sklearnsvmSVC

- Multilabel classification
 - Explicit feature map approximation for RBF (Radial Basis Function) kernels
 - Faces recognition example using eigenfaces and SVMs
 - Libsvm GUI
 - Recognizing handwritten digits
 - Plot classification probability
 - Classifier comparison
 - Concatenating multiple feature extraction methods
 - Plot the decision boundaries of a VotingClassifier
 - Crossvalidation on Digits Dataset Exercise
 - SVM (Support Vector Machine) Exercise
 - Recursive feature elimination
- 637sklearnsvm Support Vector Machines 2323

scikitlearn user guide Release 0213

- Recursive feature elimination with crossvalidation
 - Test with permutations the significance of a classification score
 - Univariate Feature Selection
 - Plotting Validation Curves
 - Parameter estimation using grid search with crossvalidation
 - Receiver Operating Characteristic ROC with cross validation
 - Nested versus nonnested crossvalidation
 - Confusion matrix
 - Receiver Operating Characteristic ROC
 - Plotting Learning Curves
 - Feature discretization
 - Decision boundary of label propagation versus SVM (Support Vector Machine) on the Iris dataset
 - SVM (Support Vector Machine) Maximum margin separating hyperplane
 - SVM (Support Vector Machine) with custom kernel
 - SVM (Support Vector Machine) Weighted samples
 - SVM (Support Vector Machine) Separating hyperplane for unbalanced classes
 - SVMKernels
 - SVMAnova SVM (Support Vector Machine) with univariate feature selection
 - SVM (Support Vector Machine) Margins Example
 - Plot different SVM (Support Vector Machine) classifiers in the iris dataset
 - RBF (Radial Basis Function) SVM (Support Vector Machine) parameters
- sklearnsvm SVR (Support Vector Regression)
- classssklearnsvm SVRkernel'rbf' degree3 gamma'autodeprecated' coef000 tol0001
- C10 epsilon01 shrinkingTrue cachesize200 verboseFalse
- maxiter1

EpsilonSupport Vector Regression

The free parameters in the model are C and epsilon

The implementation is based on libsvm The fit time complexity is more than quadratic with the number of samples which makes it hard to scale to datasets with more than a couple of 10000 samples For large datasets consider using sklearnlinearmodelLinearSVR orsklearnlinearmodelSGDRegressor instead possibly after a sklearnkernelapproximationNystroem transformer

Read more in the User Guide

Parameters

kernel string optional default'rbf' Specifies the kernel type to be used in the algorithm It must be one of 'linear' 'poly' 'rbf' 'sigmoid' 'precomputed' or a callable If none is given 'rbf' will be used If a callable is given it is used to precompute the kernel matrix

degree int optional default3 Degree of the polynomial kernel function 'poly' Ignored by all other kernels

2324 Chapter 6 API (Application Programming Interface) Reference

scikitlearn user guide Release 0213

gamma float optional default'auto' Kernel coefficient for 'rbf' 'poly' and 'sigmoid'

Current default is 'auto' which uses 1 / nfeatures if gammascale is passed then it uses 1 / nfeatures Xvar as value of gamma The current default of gamma 'auto' will change to 'scale' in version 022 'autodeprecated' a deprecated version of 'auto' is used as a default indicating that no explicit value of gamma was passed

coef0 float optional default00 Independent term in kernel function It is only significant in 'poly' and 'sigmoid'

tolfloat optional default1e3 Tolerance for stopping criterion

Cfloat optional default10 Penalty parameter C of the error term

epsilon float optional default01 Epsilon in the epsilonSVR model It specifies the epsilon-tube within which no penalty is associated in the training loss function with points predicted within a distance epsilon from the actual value

shrinking boolean optional defaultTrue Whether to use the shrinking heuristic

cachesize float optional Specify the size of the kernel cache in MB

verbose bool default False Enable verbose output Note that this setting takes advantage of a perprocess runtime setting in libsvm that if enabled may not work properly in a multithreaded context

maxiter int optional default1 Hard limit on iterations within solver or 1 for no limit

Attributes

support arraylike shape (nSV) Indices of support vectors

supportvectors arraylike shape (nSV, nfeatures) Support vectors

dualcoef array shape (1, nSV) Coefficients of the support vector in the decision function

coef array shape (1, nfeatures) Weights assigned to the features coefficients in the primal problem This is only available in the case of a linear kernel

coef is readonly property derived from dualcoef and supportvectors

intercept array shape (1) Constants in decision function

silon01 shrinkingTrue cachesize200 verboseFalse maxiter1

fitselfXysampleweightNone

Fit the SVM (Support Vector Machine) model according to the given training data

Parameters

Xarraylike sparse matrix shape nsamples nfeatures Training vectors where

nsamples is the number of samples and nfeatures is the number of features For ker

nel"precomputed" the expected shape of X is nsamples nsamples

yarraylike shape nsamples Target values class labels in classification real numbers

in regression

sampleweight arraylike shape nsamples Persample weights Rescale C per sample

Higher weights force the classifier to put more emphasis on these points

Returns

self object

Notes

If X and y are not Cordered and contiguous arrays of npfloat64 and X is not a scipysparsecsrmatrix X

andor y may be copied

If X is a dense array then the other methods will not support sparse matrices as input

getparams selfdeepTrue

Get parameters for this estimator

Parameters

deep boolean optional If True will return the parameters for this estimator and contained

subobjects that are estimators

Returns

params mapping of string to any Parameter names mapped to their values

2326 Chapter 6 API (Application Programming Interface) Reference

scikitlearn user guide Release 0213

predictselfX

Perform regression on samples in X

For an oneclass model 1 inlier or 1 outlier is returned

Parameters

Xarraylike sparse matrix shape nsamples nfeatures For kernel”precomputed”

the expected shape of X is nsamplestest nsamplestrain

Returns

ypred array shape nsamples

scoreselfXysampleweightNone

Returns the coefficient of determination R2 of the prediction

The coefficient R2 is defined as $1 - \frac{u}{v}$ where u is the residual sum of squares $y_{true} - y_{pred}$

$2sum$ and v is the total sum of squares $y_{true} - y_{truemean}$ $2sum$ The best possible score

is 10 and it can be negative because the model can be arbitrarily worse A constant model that always

predicts the expected value of y disregarding the input features would get a R2 score of 00

Parameters

Xarraylike shape nsamples nfeatures Test samples For some estimators this may

be a precomputed kernel matrix instead shape nsamples nsamplesfitted where

nsamplesfitted is the number of samples used in the fitting for the estimator

yarraylike shape nsamples or nsamples noutputs True values for X

sampleweight arraylike shape nsamples optional Sample weights

Returns

score float R2 of selfpredictX wrt y

Notes

The R2 score used when calling score on a regressor will use multioutputuniformaverage

from version 023 to keep consistent with metricsr2score This will influence the score

method of all the multioutput regressors except for multioutputMultiOutputRegressor

To specify the default value manually and avoid the warning please either call metricsr2score

directly or make a custom scorer with metricsmakescorer the builtin scorer r2 uses

multioutputuniformaverage

setparams selfparams

Set the parameters of this estimator

The method works on simple estimators as well as on nested objects such as pipelines The latter have

parameters of the form componentparameter so that it’s possible to update each component

of a nested object

Returns

self

Examples using sklearnsvmSVR

•Comparison of kernel ridge regression and SVR (Support Vector Regression)

•Prediction Latency

637sklearnsvm Support Vector Machines 2327

scikitlearn user guide Release 0213

•Support Vector Regression SVR (Support Vector Regression) using linear and nonlinear kernels
svml1minc X y loss fitintercept Return the lowest bound for C such that for C in l1minC
infinity the model is guaranteed not to be empty

sklearnsvm l1minc

sklearnsvm l1minc Xyloss’squaredhinge’ fitinterceptTrue interceptscaling10

Return the lowest bound for C such that for C in l1minC infinity the model is guaranteed not
to be empty This applies to l1 penalized classifiers such as LinearSVC with penalty’l1’ and lin
earmodelLogisticRegression with penalty’l1’

This value is valid if classweight parameter in fit is not set

Parameters

Xarraylike or sparse matrix shape nsamples nfeatures Training vector where
nsamples in the number of samples and nfeatures is the number of features

yarray shape nsamples Target vector relative to X

loss ‘squaredhinge’ ‘log’ default ‘squaredhinge’ Specifies the loss function With
‘squaredhinge’ it is the squared hinge loss aka L2 loss With ‘log’ it is the loss of
logistic regression models

fitintercept bool default True Specifies if the intercept should be fitted by the model It
must match the fit method parameter

interceptscaling float default 1 when fitintercept is True instance vector x becomes x
interceptscaling ie a “synthetic” feature with constant value equals to interceptscaling
is appended to the instance vector It must match the fit method parameter

Returns

l1minc float minimum value for C

Examples using sklearnsvml1minc

•Regularization path of L1 Logistic Regression

Returns

decvalues array predicted values

2330 Chapter 6 API (Application Programming Interface) Reference

scikitlearn user guide Release 0213
sklearnsvmlibsvm predictproba
sklearnsvmlibsvm predictproba
Predict probabilities
svmmodel stores all parameters needed to predict a given value
For speed all real work is done at the C level in function copypredict libsvmhelperc
We have to reconstruct model and parameters to make sure we stay in sync with the python object
See sklearnsvmpredict for a complete list of parameters
Parameters
Xarraylike dtypefloat
kernel 'linear' 'rbf' 'poly' 'sigmoid' 'precomputed'
Returns
decvalues array predicted values
638sklearnntree Decision Trees
The sklearnntree module includes decision treebased models for classification and regression
User guide See the Decision Trees section for further details
treeDecisionTreeClassifier criterion A decision tree classifier
treeDecisionTreeRegressor criterion A decision tree regressor
treeExtraTreeClassifier criterion An extremely randomized tree classifier
treeExtraTreeRegressor criterion An extremely randomized tree regressor
6381sklearnntree DecisionTreeClassifier
class sklearnntree DecisionTreeClassifier criterion'gini' splitter'best' maxdepthNone
minsamplessplit2 minsamplesleaf1
minweightfractionleaf00
maxfeaturesNone ran
domstateNone maxleafnodesNone
minimpuritydecrease00
minimpuritysplitNone classweightNone
presortFalse
A decision tree classifier
Read more in the User Guide
Parameters
criterion string optional default"gini" The function to measure the quality of a split Sup
ported criteria are "gini" for the Gini impurity and "entropy" for the information gain
splitter string optional default"best" The strategy used to choose the split at each node
Supported strategies are "best" to choose the best split and "random" to choose the best
random split
maxdepth int or None optional defaultNone The maximum depth of the tree If None
638sklearnntree Decision Trees 2331

scikitlearn user guide Release 0213

then nodes are expanded until all leaves are pure or until all leaves contain less than minsamplesplit samples

minsamplesplit int float optional default2 The minimum number of samples required to split an internal node

- If int then consider minsamplesplit as the minimum number
- If float then minsamplesplit is a fraction and ceilminsamplesplit nsamples are the minimum number of samples for each split

Changed in version 018 Added float values for fractions

minsamplesleaf int float optional default1 The minimum number of samples required to be at a leaf node A split point at any depth will only be considered if it leaves at least minsamplesleaf training samples in each of the left and right branches This may have the effect of smoothing the model especially in regression

- If int then consider minsamplesleaf as the minimum number
- If float then minsamplesleaf is a fraction and ceilminsamplesleaf nsamples are the minimum number of samples for each node

Changed in version 018 Added float values for fractions

minweightfractionleaf float optional default0 The minimum weighted fraction of the sum total of weights of all the input samples required to be at a leaf node Samples have equal weight when sampleweight is not provided

maxfeatures int float string or None optional defaultNone The number of features to consider when looking for the best split

- If int then consider maxfeatures features at each split
- If float then maxfeatures is a fraction and intmaxfeatures nfeatures features are considered at each split
- If "auto" then maxfeaturessqrtnfeatures
- If "sqrt" then maxfeaturesqrtnfeatures
- If "log2" then maxfeatureslog2nfeatures
- If None then maxfeaturesnfeatures

Note the search for a split does not stop until at least one valid partition of the node samples is found even if it requires to effectively inspect more than maxfeatures features

randomstate int RandomState instance or None optional defaultNone If int ran

domstate is the seed used by the random number generator If RandomState instance

randomstate is the random number generator If None the random number generator is the RandomState instance used by nprandom

maxleafnodes int or None optional defaultNone Grow a tree with maxleafnodes

in bestfirst fashion Best nodes are defined as relative reduction in impurity If None then unlimited number of leaf nodes

minimpuritydecrease float optional default0 A node will be split if this split induces a decrease of the impurity greater than or equal to this value

The weighted impurity decrease equation is the following

$N_t \cdot N \cdot \text{impurity} - N_t R \cdot N_t \cdot \text{rightimpurity}$

$- N_t L \cdot N_t \cdot \text{leftimpurity}$

2332 Chapter 6 API (Application Programming Interface) Reference

scikitlearn user guide Release 0213

where N is the total number of samples N_t is the number of samples at the current node
 N_L is the number of samples in the left child and N_R is the number of samples in the right child

NN_tN_R and N_L all refer to the weighted sum if `sampleweight` is passed
New in version 019

`minimpuritysplit` float default $1e7$ Threshold for early stopping in tree growth A node will split if its impurity is above the threshold otherwise it is a leaf

Deprecated since version 019 `minimpuritysplit` has been deprecated in favor of `minimpuritydecrease` in 019 The default value of `minimpuritysplit` will change from $1e7$ to 0 in 023 and it will be removed in 025 Use `minimpuritydecrease` instead

`classweight` dict list of dicts “balanced” or None default None Weights associated with classes in the form `classlabel weight` If not given all classes are supposed to have weight one For multioutput problems a list of dicts can be provided in the same order as the columns of `y`

Note that for multioutput including multilabel weights should be defined for each class of every column in its own dict For example for fourclass multilabel classification weights should be 0 1 1 1 0 1 1 5 0 1 1 1 0 1 1 1 instead of 11 25 31 41

The “balanced” mode uses the values of `y` to automatically adjust weights inversely proportional to class frequencies in the input data as $n_{\text{samples}} / n_{\text{classes}}$ np

`bincounty`
For multioutput the weights of each column of `y` will be multiplied

Note that these weights will be multiplied with `sampleweight` passed through the fit method if `sampleweight` is specified

`presort` bool optional default False Whether to presort the data to speed up the finding of best splits in fitting For the default settings of a decision tree on large datasets setting this to true may slow down the training process When using either a smaller dataset or a restricted depth this may speed up the training

Attributes

`classes` array of shape `n_classes` or a list of such arrays The classes labels single output problem or a list of arrays of class labels multioutput problem

`featureimportances` array of shape `n_features` Return the feature importances

`maxfeatures` int The inferred value of `maxfeatures`

`n_classes` int or list The number of classes for single output problems or a list containing the number of classes for each output for multioutput problems

`n_features` int The number of features when fit is performed

`n_outputs` int The number of outputs when fit is performed

`tree` Tree object The underlying Tree object Please refer to `helpsklearn.tree`

`treeTree` for attributes of Tree object and Understanding the decision tree structure for basic usage of these attributes

See also

`DecisionTreeRegressor`

638sklearn.tree Decision Trees 2333

Notes

The default values for the parameters controlling the size of the trees eg maxdepth minsamplesleaf etc lead to fully grown and unpruned trees which can potentially be very large on some data sets To reduce memory consumption the complexity and size of the trees should be controlled by setting those parameter values

The features are always randomly permuted at each split Therefore the best found split may vary even with the same training data and maxfeaturesnfeatures if the improvement of the criterion is identical for several splits enumerated during the search of the best split To obtain a deterministic behaviour during fitting randomstate has to be fixed

scikitlearn user guide Release 0213

applyselfXcheckinputTrue

Returns the index of the leaf that each sample is predicted as

New in version 017

Parameters

Xarraylike or sparse matrix shape nsamples nfeatures The input samples Internally it will be converted to dtype npfloat32 and if a sparse matrix is provided to a sparsecsr matrix

checkinput boolean defaultTrue Allow to bypass several input checking Don't use this parameter unless you know what you do

Returns

Xleaves arraylike shape nsamples For each datapoint x in X return the index of the leaf x ends up in Leaves are numbered within 0 selftree nodecount possibly with gaps in the numbering

decisionpath selfXcheckinputTrue

Return the decision path in the tree

New in version 018

Parameters

Xarraylike or sparse matrix shape nsamples nfeatures The input samples Internally it will be converted to dtype npfloat32 and if a sparse matrix is provided to a sparsecsr matrix

checkinput boolean defaultTrue Allow to bypass several input checking Don't use this parameter unless you know what you do

Returns

indicator sparse csr array shape nsamples nnodes Return a node indicator matrix where non zero elements indicates that the samples goes through the nodes

featureimportances

Return the feature importances

The importance of a feature is computed as the normalized total reduction of the criterion brought by that

feature It is also known as the Gini importance

Returns

featureimportances array shape nfeatures

fitselfXysampleweightNone checkinputTrue XidxsortedNone

Build a decision tree classifier from the training set X y

Parameters

Xarraylike or sparse matrix shape nsamples nfeatures The training input samples Internally it will be converted to dtype npfloat32 and if a sparse matrix is provided to a sparsecsc matrix

yarraylike shape nsamples or nsamples noutputs The target values class labels as integers or strings

sampleweight arraylike shape nsamples or None Sample weights If None then

samples are equally weighted Splits that would create child nodes with net zero or negative weight are ignored while searching for a split in each node Splits are also ignored if

they would result in any single class carrying a negative weight in either child node

638sklearn.tree Decision Trees 2335

scikitlearn user guide Release 0213

checkinput boolean defaultTrue Allow to bypass several input checking Don't use this parameter unless you know what you do

Xidxsorted arraylike shape nsamples nfeatures optional The indexes of the sorted training input samples If many tree are grown on the same dataset this allows the ordering to be cached between trees If None the data will be sorted here Don't use this parameter unless you know what to do

Returns

self object

getdepth self

Returns the depth of the decision tree

The depth of a tree is the maximum distance between the root and any leaf

getnleaves self

Returns the number of leaves of the decision tree

getparams selfdeepTrue

Get parameters for this estimator

Parameters

deep boolean optional If True will return the parameters for this estimator and contained subobjects that are estimators

Returns

params mapping of string to any Parameter names mapped to their values

predictselfXcheckinputTrue

Predict class or regression value for X

For a classification model the predicted class for each sample in X is returned For a regression model the predicted value based on X is returned

Parameters

Xarraylike or sparse matrix of shape nsamples nfeatures The input samples Internally it will be converted to dtype npfloat32 and if a sparse matrix is provided to a sparsecsr matrix

checkinput boolean defaultTrue Allow to bypass several input checking Don't use this parameter unless you know what you do

Returns

yarray of shape nsamples or nsamples noutputs The predicted classes or the predict values

predictlogproba selfX

Predict class logprobabilities of the input samples X

Parameters

Xarraylike or sparse matrix of shape nsamples nfeatures The input samples Internally it will be converted to dtype npfloat32 and if a sparse matrix is provided to a sparsecsr matrix

Returns

2336 Chapter 6 API (Application Programming Interface) Reference

scikitlearn user guide Release 0213

array of shape (n_samples, n_classes) or a list of n_outputs such arrays if n_outputs

1 The class logprobabilities of the input samples The order of the classes corresponds to that in the attribute classes

predict_proba self.Xcheckinput=True

Predict class probabilities of the input samples X

The predicted class probability is the fraction of samples of the same class in a leaf

checkinput boolean default=True Allow to bypass several input checking Don't use this parameter unless you know what you do

Parameters

X arraylike or sparse matrix of shape (n_samples, n_features) The input samples Internally it will be converted to dtype np.float32 and if a sparse matrix is provided to

a sparse matrix

checkinput bool Run checkarray on X

Returns

array of shape (n_samples, n_classes) or a list of n_outputs such arrays if n_outputs

1 The class probabilities of the input samples The order of the classes corresponds to that in the attribute classes

score self.Xysampleweight=None

Returns the mean accuracy on the given test data and labels

In multilabel classification this is the subset accuracy which is a harsh metric since you require for each sample that each label set be correctly predicted

Parameters

X arraylike shape (n_samples, n_features) Test samples

y arraylike shape (n_samples, n_outputs) True labels for X

sampleweight arraylike shape (n_samples, optional) Sample weights

Returns

score float Mean accuracy of self.predict_X wrt y

set_params self.params

Set the parameters of this estimator

The method works on simple estimators as well as on nested objects such as pipelines The latter have

parameters of the form component.parameter so that it's possible to update each component of a nested object

Returns

self

Examples using sklearn.tree.DecisionTreeClassifier

- Classifier comparison
 - Plot the decision boundaries of a VotingClassifier
 - Twoclass AdaBoost
 - Multiclass AdaBoosted Decision Trees
- 638 sklearn.tree Decision Trees 2337

scikitlearn user guide Release 0213

- Understanding the decision tree structure

6382sklearn DecisionTreeRegressor
class sklearn DecisionTreeRegressor criterion='mse' splitter='best' maxdepth=None
minsamplesplit2 minsamplesleaf1
minweightfractionleaf00 maxfeaturesNone
randomstateNone maxleafnodesNone
minimpuritydecrease00
minimpuritysplitNone presortFalse

A decision tree regressor
Read more in the User Guide

Parameters
criterion string optional default"mse" The function to measure the quality of a split Supported criteria are "mse" for the mean squared error which is equal to variance reduction as feature selection criterion and minimizes the L2 loss using the mean of each terminal node "friedmanmse" which uses mean squared error with Friedman's improvement score for potential splits and "mae" for the mean absolute error which minimizes the L1 loss using the median of each terminal node

New in version 018 Mean Absolute Error MAE criterion
splitter string optional default"best" The strategy used to choose the split at each node Supported strategies are "best" to choose the best split and "random" to choose the best random split

maxdepth int or None optional defaultNone The maximum depth of the tree If None then nodes are expanded until all leaves are pure or until all leaves contain less than minsamplesplit samples

minsamplesplit int float optional default2 The minimum number of samples required to split an internal node

- If int then consider minsamplesplit as the minimum number
- If float then minsamplesplit is a fraction and ceilminsamplesplit

nsamples are the minimum number of samples for each split

Changed in version 018 Added float values for fractions
minsamplesleaf int float optional default1 The minimum number of samples required to be at a leaf node A split point at any depth will only be considered if it leaves at least minsamplesleaf training samples in each of the left and right branches This may have the effect of smoothing the model especially in regression

- If int then consider minsamplesleaf as the minimum number
- If float then minsamplesleaf is a fraction and ceilminsamplesleaf

nsamples are the minimum number of samples for each node

Changed in version 018 Added float values for fractions
2338 Chapter 6 API (Application Programming Interface) Reference

scikitlearn user guide Release 0213

minweightfractionleaf float optional default0 The minimum weighted fraction of the sum total of weights of all the input samples required to be at a leaf node Samples have equal weight when sampleweight is not provided

maxfeatures int float string or None optional defaultNone The number of features to consider when looking for the best split

- If int then consider maxfeatures features at each split
- If float then maxfeatures is a fraction and intmaxfeatures

nfeatures features are considered at each split

- If “auto” then maxfeaturesnfeatures
- If “sqrt” then maxfeaturesqrtnfeatures
- If “log2” then maxfeatureslog2nfeatures
- If None then maxfeaturesnfeatures

Note the search for a split does not stop until at least one valid partition of the node samples is found even if it requires to effectively inspect more than maxfeatures features

randomstate int RandomState instance or None optional defaultNone If int ran

domstate is the seed used by the random number generator If RandomState instance randomstate is the random number generator If None the random number generator is the RandomState instance used by nprandom

maxleafnodes int or None optional defaultNone Grow a tree with maxleafnodes

in bestfirst fashion Best nodes are defined as relative reduction in impurity If None then unlimited number of leaf nodes

minimpuritydecrease float optional default0 A node will be split if this split induces a decrease of the impurity greater than or equal to this value

The weighted impurity decrease equation is the following

$$N_t \cdot N \cdot \text{impurity} - N_t R \cdot N_t \text{rightimpurity}$$

$$- N_t L \cdot N_t \text{leftimpurity}$$

whereNis the total number of samples Nt is the number of samples at the current node

NtL is the number of samples in the left child and NtR is the number of samples in the right child

NNtNtR andNtL all refer to the weighted sum if sampleweight is passed

New in version 019

minimpuritysplit float default1e7 Threshold for early stopping in tree growth A node will split if its impurity is above the threshold otherwise it is a leaf

Deprecated since version 019 minimpuritysplit has been deprecated in favor of

minimpuritydecrease in 019 The default value of minimpuritysplit

will change from 1e7 to 0 in 023 and it will be removed in 025 Use

minimpuritydecrease instead

presort bool optional defaultFalse Whether to presort the data to speed up the finding of best splits in fitting For the default settings of a decision tree on large datasets setting

this to true may slow down the training process When using either a smaller dataset or a restricted depth this may speed up the training

Attributes

featureimportances array of shape nfeatures Return the feature importances

638sklearn.tree Decision Trees 2339

scikitlearn user guide Release 0213
maxfeatures int The inferred value of maxfeatures
nfeatures int The number of features when fit is performed
noutputs int The number of outputs when fit is performed
tree Tree object The underlying Tree object Please refer to helpsklearn tree
treeTree for attributes of Tree object and Understanding the decision tree structure
for basic usage of these attributes
See also

DecisionTreeClassifier

Notes

The default values for the parameters controlling the size of the trees eg maxdepth
minsamplesleaf etc lead to fully grown and unpruned trees which can potentially be very large on
some data sets To reduce memory consumption the complexity and size of the trees should be controlled by
setting those parameter values
The features are always randomly permuted at each split Therefore the best found split may vary even with
the same training data and maxfeaturesnfeatures if the improvement of the criterion is identical for
several splits enumerated during the search of the best split To obtain a deterministic behaviour during fitting
randomstate has to be fixed

minimpuritysplitNone presortFalse
applyselfXcheckinputTrue

Returns the index of the leaf that each sample is predicted as

New in version 017

Parameters

Xarraylike or sparse matrix shape nsamples nfeatures The input samples Internally it will be converted to dtype npfloat32 and if a sparse matrix is provided to a sparsecsr matrix
checkinput boolean defaultTrue Allow to bypass several input checking Don't use this parameter unless you know what you do

Returns

Xleaves arraylike shape nsamples For each datapoint x in X return the index of the leaf x ends up in Leaves are numbered within 0 selftreenodecount possibly with gaps in the numbering

decisionpath selfXcheckinputTrue

Return the decision path in the tree

New in version 018

Parameters

Xarraylike or sparse matrix shape nsamples nfeatures The input samples Internally it will be converted to dtype npfloat32 and if a sparse matrix is provided to a sparsecsr matrix
checkinput boolean defaultTrue Allow to bypass several input checking Don't use this parameter unless you know what you do

Returns

indicator sparse csr array shape nsamples nnodes Return a node indicator matrix where non zero elements indicates that the samples goes through the nodes

featureimportances

Return the feature importances

The importance of a feature is computed as the normalized total reduction of the criterion brought by that feature It is also known as the Gini importance

Returns

featureimportances array shape nfeatures

scikitlearn user guide Release 0213

fitselfXysampleweightNone checkinputTrue XidxsortedNone

Build a decision tree regressor from the training set X y

Parameters

Xarraylike or sparse matrix shape nsamples nfeatures The training input samples

Internally it will be converted to dtypefloat32 and if a sparse matrix is provided

to a sparsematrix

yarraylike shape nsamples noutputs The target values real num

bers Useddtypefloat64 andorderC for maximum efficiency

sampleweight arraylike shape nsamples or None Sample weights If None then

samples are equally weighted Splits that would create child nodes with net zero or nega

tive weight are ignored while searching for a split in each node

checkinput boolean defaultTrue Allow to bypass several input checking Don't use

this parameter unless you know what you do

Xidxsorted arraylike shape nsamples nfeatures optional The indexes of the

sorted training input samples If many tree are grown on the same dataset this allows the

ordering to be cached between trees If None the data will be sorted here Don't use this

parameter unless you know what to do

Returns

self object

getdepth self

Returns the depth of the decision tree

The depth of a tree is the maximum distance between the root and any leaf

getnleaves self

Returns the number of leaves of the decision tree

getparams selfdeepTrue

Get parameters for this estimator

Parameters

deep boolean optional If True will return the parameters for this estimator and contained

subobjects that are estimators

Returns

params mapping of string to any Parameter names mapped to their values

predictselfXcheckinputTrue

Predict class or regression value for X

For a classification model the predicted class for each sample in X is returned For a regression model

the predicted value based on X is returned

Parameters

scikitlearn user guide Release 0213

array of shape nsamples or nsamples noutputs The predicted classes or the predict values

scoreselfXysampleweightNone

Returns the coefficient of determination R2 of the prediction

The coefficient R2 is defined as $1 - \frac{u}{v}$ where u is the residual sum of squares $y_{true} - y_{pred}$

2sum and v is the total sum of squares $y_{true} - y_{truemean}$ 2sum The best possible score

is 10 and it can be negative because the model can be arbitrarily worse A constant model that always

predicts the expected value of y disregarding the input features would get a R2 score of 00

Parameters

Xarraylike shape nsamples nfeatures Test samples For some estimators this may

be a precomputed kernel matrix instead shape nsamples nsamplesfitted where

nsamplesfitted is the number of samples used in the fitting for the estimator

yarraylike shape nsamples or nsamples noutputs True values for X

sampleweight arraylike shape nsamples optional Sample weights

Returns

score float R2 of selfpredictX wrt y

Notes

The R2 score used when calling score on a regressor will use multioutputuniformaverage

from version 023 to keep consistent with metricsr2score This will influence the score

method of all the multioutput regressors except for multioutputMultiOutputRegressor

To specify the default value manually and avoid the warning please either call metricsr2score

directly or make a custom scorer with metricsmakescorer the builtin scorer r2 uses

multioutputuniformaverage

setparams selfparams

Set the parameters of this estimator

The method works on simple estimators as well as on nested objects such as pipelines The latter have

parameters of the form componentparameter so that it's possible to update each component

of a nested object

Returns

self

maxdepthNone minsamplesplit2

minsamplesleaf1 minweightfractionleaf00

maxfeatures'auto' randomstateNone

maxleafnodesNone minimpuritydecrease00

minimpuritysplitNone classweightNone

An extremely randomized tree classifier

Extratrees differ from classic decision trees in the way they are built When looking for the best split to separate the samples of a node into two groups random splits are drawn for each of the maxfeatures randomly selected features and the best split among those is chosen When maxfeatures is set 1 this amounts to building a totally random decision tree

Warning Extratrees should only be used within ensemble methods

Read more in the User Guide

Parameters

criterion string optional default"gini" The function to measure the quality of a split Sup

ported criteria are "gini" for the Gini impurity and "entropy" for the information gain

splitter string optional default"random" The strategy used to choose the split at each node

Supported strategies are "best" to choose the best split and "random" to choose the best

random split

maxdepth int or None optional defaultNone The maximum depth of the tree If None

then nodes are expanded until all leaves are pure or until all leaves contain less than

minsamplesplit samples

minsamplesplit int float optional default2 The minimum number of samples required to split an internal node

- If int then consider minsamplesplit as the minimum number

- If float then minsamplesplit is a fraction and ceilminsamplesplit

nsamples are the minimum number of samples for each split

Changed in version 018 Added float values for fractions

minsamplesleaf int float optional default1 The minimum number of samples required

to be at a leaf node A split point at any depth will only be considered if it leaves at least

minsamplesleaf training samples in each of the left and right branches This may

have the effect of smoothing the model especially in regression

- If int then consider minsamplesleaf as the minimum number

- If float then minsamplesleaf is a fraction and ceilminsamplesleaf

nsamples are the minimum number of samples for each node

Changed in version 018 Added float values for fractions

minweightfractionleaf float optional default0 The minimum weighted fraction of the

sum total of weights of all the input samples required to be at a leaf node Samples have equal weight when sampleweight is not provided

maxfeatures int float string or None optional default"auto" The number of features to consider when looking for the best split

- If int then consider maxfeatures features at each split

2344 Chapter 6 API (Application Programming Interface) Reference

scikitlearn user guide Release 0213

- If float then maxfeatures is a fraction and intmaxfeatures nfeatures features are considered at each split
- If “auto” then maxfeaturesqrtnfeatures
- If “sqrt” then maxfeaturesqrtnfeatures
- If “log2” then maxfeatureslog2nfeatures
- If None then maxfeaturesnfeatures

Note the search for a split does not stop until at least one valid partition of the node samples is found even if it requires to effectively inspect more than maxfeatures features

randomstate int RandomState instance or None optional defaultNone If int ran domstate is the seed used by the random number generator If RandomState instance randomstate is the random number generator If None the random number generator is the RandomState instance used by nprandom

maxleafnodes int or None optional defaultNone Grow a tree with maxleafnodes in bestfirst fashion Best nodes are defined as relative reduction in impurity If None then unlimited number of leaf nodes

minimpuritydecrease float optional default0 A node will be split if this split induces a decrease of the impurity greater than or equal to this value

The weighted impurity decrease equation is the following

$$Nt \cdot N \cdot \text{impurity} - NtR \cdot Nt \cdot \text{rightimpurity} - NtL \cdot Nt \cdot \text{leftimpurity}$$

whereNis the total number of samples Nt is the number of samples at the current node NtL is the number of samples in the left child and NtR is the number of samples in the right child

NNtNtR andNtL all refer to the weighted sum if sampleweight is passed

New in version 019

minimpuritysplit float default1e7 Threshold for early stopping in tree growth A node will split if its impurity is above the threshold otherwise it is a leaf

Deprecated since version 019 minimpuritysplit has been deprecated in favor of

minimpuritydecrease in 019 The default value of minimpuritysplit will change from 1e7 to 0 in 023 and it will be removed in 025 Use

minimpuritydecrease instead

classweight dict list of dicts “balanced” or None defaultNone Weights associated with classes in the form classlabel weight If not given all classes are supposed to have weight one For multioutput problems a list of dicts can be provided in the same order as the columns of y

Note that for multioutput including multilabel weights should be defined for each class of every column in its own dict For example for fourclass multilabel classification weights should be 0 1 1 1 0 1 1 5 0 1 1 1 0 1 1 1 instead of 11 25

31 41

The “balanced” mode uses the values of y to automatically adjust weights inversely proportional to class frequencies in the input data as nsamples nclasses np

bincounty

For multioutput the weights of each column of y will be multiplied

638sklearntree Decision Trees 2345

scikitlearn user guide Release 0213

Note that these weights will be multiplied with sampleweight passed through the fit method if sampleweight is specified

Attributes

featureimportances Return the feature importances

randomstate int RandomState instance or None optional defaultNone If int ran

domstate is the seed used by the random number generator If RandomState instance

2350 Chapter 6 API (Application Programming Interface) Reference

scikitlearn user guide Release 0213

randomstate is the random number generator If None the random number generator is the RandomState instance used by nprandom

minimpuritydecrease float optional default0 A node will be split if this split induces a decrease of the impurity greater than or equal to this value

The weighted impurity decrease equation is the following

$$Nt - N \text{ impurity} - NtR - Nt \text{ rightimpurity}$$

$$NtL - Nt \text{ leftimpurity}$$

whereNis the total number of samples Nt is the number of samples at the current node

NtL is the number of samples in the left child and NtR is the number of samples in the right child

NNtNtR andNtL all refer to the weighted sum if sampleweight is passed

New in version 019

minimpuritysplit float default1e7 Threshold for early stopping in tree growth A node

will split if its impurity is above the threshold otherwise it is a leaf

Deprecated since version 019 minimpuritysplit has been deprecated in favor of

minimpuritydecrease in 019 The default value of minimpuritysplit

will change from 1e7 to 0 in 023 and it will be removed in 025 Use

minimpuritydecrease instead

maxleafnodes int or None optional defaultNone Grow a tree with maxleafnodes

in bestfirst fashion Best nodes are defined as relative reduction in impurity If None then

unlimited number of leaf nodes

Attributes

featureimportances Return the feature importances

See also

ExtraTreeClassifier sklearnensembleExtraTreesClassifier

sklearnensembleExtraTreesRegressor

Notes

The default values for the parameters controlling the size of the trees eg maxdepth

minsamplesleaf etc lead to fully grown and unpruned trees which can potentially be very large on

some data sets To reduce memory consumption the complexity and size of the trees should be controlled by

setting those parameter values

Methods

638sklearnrtree Decision Trees 2351

scikitlearn user guide Release 0213

apply self X checkinput Returns the index of the leaf that each sample is predicted as

decisionpath self X checkinput Return the decision path in the tree

fitself X y sampleweight Build a decision tree regressor from the training set X y

getdepth self Returns the depth of the decision tree

getnleaves self Returns the number of leaves of the decision tree

getparams self deep Get parameters for this estimator

predict self X checkinput Predict class or regression value for X

score self X y sampleweight Returns the coefficient of determination R2 of the prediction

setparams self params Set the parameters of this estimator

init selfcriterion'mse' splitter'random' maxdepthNone minsamplesplit2

minsamplesleaf1 minweightfractionleaf00 maxfeatures'auto'

randomstateNone minimpuritydecrease00 minimpuritysplitNone

maxleafnodesNone

applyselfXcheckinputTrue

Returns the index of the leaf that each sample is predicted as

New in version 017

Parameters

Xarraylike or sparse matrix shape nsamples nfeatures The input samples Internally it will be converted to dtype npfloat32 and if a sparse matrix is provided to a sparsecsr matrix

checkinput boolean defaultTrue Allow to bypass several input checking Don't use this parameter unless you know what you do

Returns

Xleaves arraylike shape nsamples For each datapoint x in X return the index of the leaf x ends up in Leaves are numbered within 0 selftree nodecount possibly with gaps in the numbering

decisionpath selfXcheckinputTrue

Return the decision path in the tree

New in version 018

Parameters

Xarraylike or sparse matrix shape nsamples nfeatures The input samples Internally it will be converted to dtype npfloat32 and if a sparse matrix is provided to a sparsecsr matrix

checkinput boolean defaultTrue Allow to bypass several input checking Don't use this parameter unless you know what you do

Returns

indicator sparse csr array shape nsamples nnodes Return a node indicator matrix where non zero elements indicates that the samples goes through the nodes feature importances

Return the feature importances

2352 Chapter 6 API (Application Programming Interface) Reference

scikitlearn user guide Release 0213

The importance of a feature is computed as the normalized total reduction of the criterion brought by that feature It is also known as the Gini importance

Returns

featureimportances array shape nfeatures

fitselfXysampleweightNone checkinputTrue XidxsortedNone

Build a decision tree regressor from the training set X y

Parameters

Xarraylike or sparse matrix shape nsamples nfeatures The training input samples

Internally it will be converted to dtypefloat32 and if a sparse matrix is provided to a sparsecscmatrix

yarraylike shape nsamples or nsamples noutputs The target values real num

bers Useddtypefloat64 andorderC for maximum efficiency

sampleweight arraylike shape nsamples or None Sample weights If None then

samples are equally weighted Splits that would create child nodes with net zero or nega

tive weight are ignored while searching for a split in each node

checkinput boolean defaultTrue Allow to bypass several input checking Don't use

this parameter unless you know what you do

Xidxsorted arraylike shape nsamples nfeatures optional The indexes of the

sorted training input samples If many tree are grown on the same dataset this allows the

ordering to be cached between trees If None the data will be sorted here Don't use this

parameter unless you know what to do

Returns

self object

getdepth self

Returns the depth of the decision tree

The depth of a tree is the maximum distance between the root and any leaf

getnleaves self

Returns the number of leaves of the decision tree

getparams selfdeepTrue

Get parameters for this estimator

Parameters

deep boolean optional If True will return the parameters for this estimator and contained

subobjects that are estimators

Returns

params mapping of string to any Parameter names mapped to their values

predictselfXcheckinputTrue

Predict class or regression value for X

For a classification model the predicted class for each sample in X is returned For a regression model

the predicted value based on X is returned

Parameters

638sklearnntree Decision Trees 2353

scikitlearn user guide Release 0213

Xarraylike or sparse matrix of shape nsamples nfeatures The input samples Internally it will be converted to dtype np.float32 and if a sparse matrix is provided to a sparse csr matrix

checkinput boolean default True Allow to bypass several input checking Don't use this parameter unless you know what you do

Returns

yarray of shape nsamples or nsamples noutputs The predicted classes or the predict values

score self.Xysampleweight None

Returns the coefficient of determination R2 of the prediction

The coefficient R2 is defined as $1 - \frac{u}{v}$ where u is the residual sum of squares $y_{true} - y_{pred}$

$2sum$ and v is the total sum of squares $y_{true} - y_{true\text{mean}}$ $2sum$ The best possible score is 1.0 and it can be negative because the model can be arbitrarily worse A constant model that always predicts the expected value of y disregarding the input features would get a R2 score of 0.0

Parameters

Xarraylike shape nsamples nfeatures Test samples For some estimators this may

be a precomputed kernel matrix instead shape nsamples nsamplesfitted where nsamplesfitted is the number of samples used in the fitting for the estimator

yarraylike shape nsamples or nsamples noutputs True values for X

sampleweight arraylike shape nsamples optional Sample weights

Returns

score float R2 of self.predict(X) wrt y

Notes

The R2 score used when calling score on a regressor will use multioutputuniformaverage

from version 0.23 to keep consistent with metrics.r2score This will influence the score

method of all the multioutput regressors except for multioutput.MultiOutputRegressor

To specify the default value manually and avoid the warning please either call metrics.r2score

directly or make a custom scorer with metrics.make_scorer the builtin scorer r2 uses

multioutputuniformaverage

set_params self.params

Set the parameters of this estimator

The method works on simple estimators as well as on nested objects such as pipelines The latter have parameters of the form component.parameter so that it's possible to update each component

of a nested object

Returns

self

tree.export_graphviz decisiontree Export a decision tree in DOT format

tree.plot_tree decisiontree maxdepth Plot a decision tree

tree.export_text decisiontree Build a text report showing the rules of a decision tree

2354 Chapter 6 API (Application Programming Interface) Reference

scikitlearn user guide Release 0213

6385sklearn.tree.export_graphviz

sklearn.tree.export_graphviz decisiontree outfile=None maxdepth=None feature_names=None class_names=None label='all' filled=False leaves_parallel=False impurity=True node_ids=False proportion=False rotate=False rounded=False special_characters=False precision=3

Export a decision tree in DOT format

This function generates a GraphViz representation of the decision tree which is then written into outfile

Once exported graphical renderings can be generated using for example

- dot Tps treedot o treeps PostScript format
- dot Tpng treedot o treepng PNG format

The sample counts that are shown are weighted with any sample weights that might be present

Read more in the User Guide

Parameters

decisiontree decision tree classifier The decision tree to be exported to GraphViz

outfile file object or string optional default=None Handle or name of the output file If None the result is returned as a string

Changed in version 020 Default of outfile changed from “treedot” to None

maxdepth int optional default=None The maximum depth of the representation If None the tree is fully generated

feature_names list of strings optional default=None Names of each of the features

class_names list of strings bool or None optional default=None Names of each of the target classes in ascending numerical order Only relevant for classification and not supported for multioutput

If True shows a symbolic representation of the class name

label 'all' 'root' 'none' optional default='all' Whether to show informative labels for impurity etc Options include 'all' to show at every node 'root' to show only at the top root node or 'none' to not show at any node

filled bool optional default=False When set to True paint nodes to indicate majority class for classification extremity of values for regression or purity of node for multioutput

leaves_parallel bool optional default=False When set to True draw all leaf nodes at the bottom of the tree

impurity bool optional default=True When set to True show the impurity at each node

node_ids bool optional default=False When set to True show the ID number on each node

proportion bool optional default=False When set to True change the display of 'values' and/or 'samples' to be proportions and percentages respectively

rotate bool optional default=False When set to True orient tree left to right rather than topdown

rounded bool optional default=False When set to True draw node boxes with rounded corners and use Helvetica fonts instead of TimesRoman

special_characters bool optional default=False When set to False ignore special characters for PostScript compatibility

638sklearn.tree Decision Trees 2355

scikitlearn user guide Release 0213

precision int optional default3 Number of digits of precision for floating point in the values of impurity threshold and value attributes of each node

Returns
dotdata string String representation of the input tree in GraphViz dot format Only returned if outfile is None

New in version 018

Examples
from sklearn.datasets import load_iris
from sklearn import tree
clf = tree.DecisionTreeClassifier

iris = load_iris
clf = clf.fit(iris.data, iris.target)
tree.export_graphviz(clf,

digraph Tree
6386sklearn.tree.plot_tree
sklearn.tree.plot_tree(decision_tree, max_depth=None, feature_names=None, class_names=None, label='all', filled=False, impurity=True, node_ids=False, proportion=False, rotate=False, rounded=False, precision=3, ax=None, font_size=None)

Plot a decision tree
The sample counts that are shown are weighted with any sample weights that might be present This function requires matplotlib and works best with matplotlib 1.5
The visualization is fit automatically to the size of the axis Use the figsize or dpi arguments of plt.figure to control the size of the rendering

Read more in the User Guide

New in version 021

Parameters
decision_tree decision tree regressor or classifier The decision tree to be exported to GraphViz
max_depth int optional defaultNone The maximum depth of the representation If None the tree is fully generated
feature_names list of strings optional defaultNone Names of each of the features
class_names list of strings bool or None optional defaultNone Names of each of the target classes in ascending numerical order Only relevant for classification and not supported for multioutput If True shows a symbolic representation of the class name
label 'all' 'root' 'none' optional default'all' Whether to show informative labels for impurity etc Options include 'all' to show at every node 'root' to show only at the top root node or 'none' to not show at any node

2356 Chapter 6 API (Application Programming Interface) Reference

scikitlearn user guide Release 0213

filled bool optional defaultFalse When set to True paint nodes to indicate majority class for classification extremity of values for regression or purity of node for multioutput

impurity bool optional defaultTrue When set to True show the impurity at each node

nodeids bool optional defaultFalse When set to True show the ID number on each node

proportion bool optional defaultFalse When set to True change the display of 'values' andor 'samples' to be proportions and percentages respectively

rotate bool optional defaultFalse When set to True orient tree left to right rather than topdown

rounded bool optional defaultFalse When set to True draw node boxes with rounded corners and use Helvetica fonts instead of TimesRoman

precision int optional default3 Number of digits of precision for floating point in the values of impurity threshold and value attributes of each node

axmatplotlib axis optional defaultNone Axes to plot to If None use current axis Any previous content is cleared

fontsize int optional defaultNone Size of text font If None determined automatically to fit figure

Returns
annotations list of artists List containing the artists for the annotation boxes making up the tree

Examples
from sklearn.datasets import loadiris
from sklearn import tree
clf = tree.DecisionTreeClassifier(random_state=0)
iris = loadiris
clf = clf.fit(iris.data, iris.target)
tree.plot_tree(clf)
Text2515345217X3 08

Examples using sklearn.tree.plot_tree
•Plot the decision surface of a decision tree on the iris dataset

6387sklearn.tree.export_text
sklearn.tree.export_text(decision_tree, feature_names=None, max_depth=10, spacing=3, decimals=2, show_weights=False)

Build a text report showing the rules of a decision tree
Note that backwards compatibility may not be supported
Parameters

638sklearn.tree Decision Trees 2357

scikitlearn user guide Release 0213

decisiontree object The decision tree estimator to be exported It can be an instance of DecisionTreeClassifier or DecisionTreeRegressor
featurenames list optional defaultNone A list of length nfeatures containing the feature names If None generic names will be used "feature0" "feature1"
maxdepth int optional default10 Only the first maxdepth levels of the tree are exported Truncated branches will be marked with " "
spacing int optional default3 Number of spaces between edges The higher it is the wider the result

decimals int optional default2 Number of decimal digits to display
showweights bool optional defaultFalse If true the classification weights will be exported on each leaf The classification weights are the number of samples each class
Returns

report string Text summary of all the rules in the decision tree

Examples

```
from sklearn.datasets import load_iris
from sklearn.tree import DecisionTreeClassifier
from sklearn.tree.export import export_text

iris = load_iris()
X, y = iris.data, iris.target
decisiontree = DecisionTreeClassifier(random_state=0, max_depth=2)
decisiontree.fit(X, y)
r = export_text(decisiontree, feature_names=iris.feature_names)
print(r)

petal width cm 0.80
class 0
petal width cm 0.80
petal width cm 1.75
class 1
petal width cm 1.75
class 2
```

639sklearnutils Utilities

6391sklearnutils arrayfuncscholeskydelete

6392sklearnutilsarrayfuncs minpos

sklearnutilsarrayfuncs minpos

Find the minimum value of an array over positive values

Returns a huge value if none of the values are positive

6393sklearnutils asfloatarray

sklearnutils asfloatarray XcopyTrue forceallfiniteTrue

Converts an arraylike to an array of floats

The new dtype will be npfloat32 or npfloat64 depending on the original type The function can create a copy

or modify the argument depending on the argument copy

Parameters

Xarraylike sparse matrix

copy bool optional If True a copy of X will be created If False a copy may still be returned

if X’s dtype is not a floating point type

forceallfinite boolean or ‘allownan’ defaultTrue Whether to raise an error on npinf

and npnan in X The possibilities are

- True Force all values of X to be finite
- False accept both npinf and npnan in X
- ‘allownan’ accept only npnan values in X Values cannot be infinite

New in version 020 forceallfinite accepts the string allownan

Returns

2360 Chapter 6 API (Application Programming Interface) Reference

scikitlearn user guide Release 0213

XT array sparse matrix An array of type npfloat

6394sklearnutils assertallfinite

sklearnutils assertallfinite XallownanFalse

Throw a ValueError if X contains NaN or infinity

Parameters

Xarray or sparse matrix

allownan bool

6395sklearnutils checkXy

sklearnutils checkXy XyacceptsparseFalse acceptlargesparsedTrue dtype'numeric'

orderNone copyFalse forceallfiniteTrue ensure2dTrue

allowndFalse multioutputFalse ensureminsamples1 en

sureminfeatures1 ynumericFalse warnondtypeNone estima

torNone

Input validation for standard estimators

Checks X and y for consistent length enforces X to be 2D and y 1D By default X is checked to be nonempty and containing only finite values Standard input checks are also applied to y such as checking that y does not have npnan or npinf targets For multilabel y set multioutputTrue to allow 2D and sparse y If the dtype of X is object attempt converting to float raising on failure

Parameters

Xndarray list or sparse matrix Input data

yndarray list or sparse matrix Labels

acceptsparse string boolean or list of string defaultFalse Strings representing allowed

sparse matrix formats such as 'csc' 'csr' etc If the input is sparse but not in the allowed format it will be converted to the first listed format True allows the input to be any format False means that a sparse matrix input will raise an error

acceptlargesparsed bool defaultTrue If a CSR (Compressed Sparse Row) CSC COO or BSR sparse matrix is supplied and accepted by acceptsparse acceptlargesparsed will cause it to be accepted only if its indices are stored with a 32bit dtype

New in version 020

dtype string type list of types or None default"numeric" Data type of result If None the dtype of the input is preserved If "numeric" dtype is preserved unless arraydtype is object If dtype is a list of types conversion on the first type is only performed if the dtype of the input is not in the list

order 'F' 'C' or None defaultNone Whether an array will be forced to be fortran or cstyle

copy boolean defaultFalse Whether a forced copy will be triggered If copyFalse a copy might be triggered by a conversion

forceallfinite boolean or 'allownan' defaultTrue Whether to raise an error on npinf and npnan in X This parameter does not influence whether y can have npinf or npnan values The possibilities are

- True Force all values of X to be finite

639sklearnutils Utilities 2361

scikitlearn user guide Release 0213

- False accept both npinf and npnan in X
- ‘allownan’ accept only npnan values in X Values cannot be infinite

New in version 020 forceallfinite accepts the string allownan

ensure2d boolean defaultTrue Whether to raise a value error if X is not 2D

allownd boolean defaultFalse Whether to allow Xndim 2

multioutput boolean defaultFalse Whether to allow 2D y array or sparse matrix

If false y will be validated as a vector y cannot have npnan or npinf values if

multioutputTrue

ensureminsamples int default1 Make sure that X has a minimum number of samples in its first axis rows for a 2D array

ensureminfeatures int default1 Make sure that the 2D array has some minimum number of features columns The default value of 1 rejects empty datasets This check is only enforced when X has effectively 2 dimensions or is originally 1D and ensure2d is True Setting to 0 disables this check

ynumeric boolean defaultFalse Whether to ensure that y has a numeric type If dtype of

y is object it is converted to float64 Should only be used for regression algorithms

warnondtype boolean or None optional defaultNone Raise DataConversionWarning if the dtype of the input data structure does not match the requested dtype causing a memory copy

Deprecated since version 021 warnondtype is deprecated in version 021 and will be removed in 023

estimator str or estimator instance defaultNone If passed include the name of the estimator in warning messages

Returns

Xconverted object The converted and validated X

yconverted object The converted and validated y

6396sklearnutils checkarray

sklearnutils checkarray array acceptsparseFalse acceptlargesparseTrue

dtype‘numeric’ orderNone copyFalse forceallfiniteTrue

ensure2dTrue allowndFalse ensureminsamples1 en

sureminfeatures1 warnondtypeNone estimatorNone

Input validation on an array list sparse matrix or similar

By default the input is checked to be a nonempty 2D array containing only finite values If the dtype of the array is object attempt converting to float raising on failure

Parameters

array object Input object to check convert

acceptsparse string boolean or listtuple of strings defaultFalse Strings representing

allowed sparse matrix formats such as ‘csc’ ‘csr’ etc If the input is sparse but not in the

allowed format it will be converted to the first listed format True allows the input to be any format False means that a sparse matrix input will raise an error

2362 Chapter 6 API (Application Programming Interface) Reference

scikitlearn user guide Release 0213

acceptlargesparsed bool defaultTrue If a CSR (Compressed Sparse Row) CSC COO or BSR sparse matrix is supplied and accepted by acceptsparsed acceptlargesparsedFalse will cause it to be accepted only if its indices are stored with a 32bit dtype

New in version 020

dtype string type list of types or None default"numeric" Data type of result If None the dtype of the input is preserved If "numeric" dtype is preserved unless arraydtype is object If dtype is a list of types conversion on the first type is only performed if the dtype of the input is not in the list

order 'F' 'C' or None defaultNone Whether an array will be forced to be fortran or cstyle When order is None default then if copyFalse nothing is ensured about the memory layout of the output array otherwise copyTrue the memory layout of the returned array is kept as close as possible to the original array

copy boolean defaultFalse Whether a forced copy will be triggered If copyFalse a copy might be triggered by a conversion

forceallfinite boolean or 'allownan' defaultTrue Whether to raise an error on npinf and npnan in array The possibilities are

- True Force all values of array to be finite
- False accept both npinf and npnan in array
- 'allownan' accept only npnan values in array Values cannot be infinite

For object dtypes data only npnan is checked and not npinf

New in version 020 forceallfinite accepts the string allownan

ensure2d boolean defaultTrue Whether to raise a value error if array is not 2D

allownd boolean defaultFalse Whether to allow arrayndim 2

ensureminsamples int default1 Make sure that the array has a minimum number of samples in its first axis rows for a 2D array Setting to 0 disables this check

ensureminfeatures int default1 Make sure that the 2D array has some minimum number of features columns The default value of 1 rejects empty datasets This check is only enforced when the input data has effectively 2 dimensions or is originally 1D and ensure2d is True Setting to 0 disables this check

warnondtype boolean or None optional defaultNone Raise DataConversionWarning if the dtype of the input data structure does not match the requested dtype causing a memory copy

Deprecated since version 021 warnondtype is deprecated in version 021 and will be removed in 023

estimator str or estimator instance defaultNone If passed include the name of the estimator in warning messages

Returns

arrayconverted object The converted and validated array

6397sklearnutils checkscalar

sklearnutils checkscalar xname targettype minvalNone maxvalNone

Validate scalar parameters type and value

639sklearnutils Utilities 2363

Parameters

xobject The scalar parameter to validate
name str The name of the parameter to be printed in error messages
targettype type or tuple Acceptable data types for the parameter
minval float or int optional defaultNone The minimum valid value the parameter can take If None default it is implied that the parameter does not have a lower bound
maxval float or int optional defaultNone The maximum valid value the parameter can take If None default it is implied that the parameter does not have an upper bound

Raises

TypeError If the parameter’s type does not match the desired type

ValueError If the parameter’s value violates the given bounds

6398sklearnutils checkconsistentlength
sklearnutils checkconsistentlength arrays

Check that all arrays have consistent first dimensions

Checks whether all objects in arrays have the same shape or length

Parameters

arrays list or tuple of input objects Objects that will be checked for consistent length

6399sklearnutils checkrandomstate

sklearnutils checkrandomstate seed

Turn seed into a nprandomRandomState instance

Parameters

seed None int instance of RandomState If seed is None return the RandomState singleton

used by nprandom If seed is an int return a new RandomState instance seeded with seed

If seed is already a RandomState instance return it Otherwise raise ValueError

Examples using sklearnutilscheckrandomstate

- Isotonic Regression
 - Face completion with a multioutput estimators
 - Empirical evaluation of the impact of kmeans initialization
 - MNIST classffication using multinomial logistic L1
 - Manifold Learning methods on a severed sphere
 - Scaling the regularization parameter for SVCs
- 2364 Chapter 6 API (Application Programming Interface) Reference

scikitlearn user guide Release 0213
63910sklearnutilsclassweight computeclassweight
sklearnutilsclassweight computeclassweight classweight classes y
Estimate class weights for unbalanced datasets
Parameters
classweight dict 'balanced' or None If 'balanced' class weights will be given by
nsamples nclasses npbincounty If a dictionary is given keys
are classes and values are corresponding class weights If None is given the class weights
will be uniform
classes ndarray Array of the classes occurring in the data as given by npuniqueyorg
withyorg the original class labels
yarraylike shape nsamples Array of original class labels per sample
Returns
classweightvect ndarray shape nclasses Array with classweightvecti the weight for
ith class
References
The "balanced" heuristic is inspired by Logistic Regression in Rare Events Data King Zen 2001
63911sklearnutilsclassweight computesampleweight
sklearnutilsclassweight computesampleweight classweight yindicesNone
Estimate sample weights by class for unbalanced datasets
Parameters
classweight dict list of dicts "balanced" or None optional Weights associated with classes
in the form classlabel weight If not given all classes are supposed to have
weight one For multioutput problems a list of dicts can be provided in the same order as
the columns of y
Note that for multioutput including multilabel weights should be defined for each class of
every column in its own dict For example for fourclass multilabel classification weights
should be 0 1 1 1 0 1 1 5 0 1 1 1 0 1 1 1 instead of 11 25
31 41
The "balanced" mode uses the values of y to automatically adjust weights inversely pro
portional to class frequencies in the input data nsamples nclasses np
bincounty
For multioutput the weights of each column of y will be multiplied
yarraylike shape nsamples or nsamples noutputs Array of original class labels per
sample
indices arraylike shape nsubsample or None Array of indices to be used in a subsample
Can be of length less than nsamples in the case of a subsample or equal to nsamples in
the case of a bootstrap subsample with repeated indices If None the sample weight will
be calculated over the full sample Only "balanced" is supported for classweight if this is
provided
Returns
639sklearnutils Utilities 2365

scikitlearn user guide Release 0213

sampleweightvect ndarray shape nsamples Array with sample weights as applied to the original y

63912sklearnutils deprecated

sklearnutils deprecated extra''

Decorator to mark a function or class as deprecated

Issue a warning when the function is calledthe class is instantiated and adds a warning to the docstring

The optional extra argument will be appended to the deprecation message and the docstring Note to use this with the default value for extra put in an empty of parentheses

from sklearnutils import deprecated

deprecated

sklearnutilsdeprecationdeprecated object at

deprecated

def somefunction pass

Parameters

extra string to be added to the deprecation messages

63913sklearnutilsestimatorchecks checkestimator

sklearnutilsestimatorchecks checkestimator Estimator

Check if estimator adheres to scikitlearn conventions

This estimator will run an extensive testsuite for input validation shapes etc Additional tests for classifiers regressors clustering or transformers will be run if the Estimator class inherits from the corresponding mixin from sklearnbase

This test can be applied to classes or instances Classes currently have some additional tests that related to construction while passing instances allows the testing of multiple options

Parameters

estimator estimator object or class Estimator to check Estimator is a class object or instance

63914sklearnutilsextmath safesparsedot

sklearnutilsextmath safesparsedot abdenseoutputFalse

Dot product that handle the sparse matrix case correctly

Uses BLAS GEMM as replacement for numpydot where possible to avoid unnecessary copies

Parameters

aarray or sparse matrix

barray or sparse matrix

denseoutput boolean default False When False either aorbbbeing sparse will yield sparse output When True output will always be an array

Returns

2366 Chapter 6 API (Application Programming Interface) Reference

scikitlearn user guide Release 0213

dotproduct array or sparse matrix sparse if aorbis sparse and denseoutputFalse

63915sklearnutilsextmath randomizedrangefinder

sklearnutilsextmath randomizedrangefinder A size niter

poweriterationnormalizer'auto'

randomstateNone

Computes an orthonormal matrix whose range approximates the range of A

Parameters

A2D array The input data matrix

size integer Size of the return array

niter integer Number of power iterations used to stabilize the result

poweriterationnormalizer 'auto' default 'QR' 'LU' 'none' Whether the power iter

ations are normalized with stepbystep QR factorization the slowest but most accurate

'none' the fastest but numerically unstable when niter is large eg typically 5 or

larger or 'LU' factorization numerically stable but can lose slightly in accuracy The

'auto' mode applies no normalization if niter > 2 and switches to LU otherwise

New in version 0.18

randomstate int RandomState instance or None optional defaultNone The seed of the

pseudo random number generator to use when shuffling the data If int randomstate is

the seed used by the random number generator If RandomState instance randomstate is

the random number generator If None the random number generator is the RandomState

instance used by np.random

Returns

Q2D array A size x size projection matrix the range of which approximates well the range

of the input matrix A

Notes

Follows Algorithm 4.3 of Finding structure with randomness Stochastic algorithms for constructing approxi

mate matrix decompositions Halko et al 2009 arXiv:0909.4061v1 [math.NA] <https://arxiv.org/pdf/0909.4061.pdf>

An implementation of a randomized algorithm for principal component analysis A Szlam et al 2014

63916sklearnutilsextmath randomizedsvd

sklearnutilsextmath randomizedsvd M ncomponents noversamples10 niter'auto'

poweriterationnormalizer'auto' transpose'auto'

flipsignTrue randomstate0

Computes a truncated randomized SVD

Parameters

M ndarray or sparse matrix Matrix to decompose

ncomponents int Number of singular values and vectors to extract

noversamples int default is 10 Additional number of random vectors to sample the range

of M so as to ensure proper conditioning The total number of random vectors used to find

639sklearnutils Utilities 2367

scikitlearn user guide Release 0213

the range of M is ncomponents noversamples Smaller number can improve speed but can negatively impact the quality of approximation of singular vectors and singular values
niter int or 'auto' default is 'auto' Number of power iterations It can be used to deal with very noisy problems When 'auto' it is set to 4 unless ncomponents is small
1 minXshape niter in which case is set to 7 This improves precision with few components

Changed in version 018

poweriterationnormalizer 'auto' default 'QR' 'LU' 'none' Whether the power iterations are normalized with stepbystep QR factorization the slowest but most accurate 'none' the fastest but numerically unstable when niter is large eg typically 5 or larger or 'LU' factorization numerically stable but can lose slightly in accuracy The 'auto' mode applies no normalization if niter 2 and switches to LU otherwise

New in version 018

transpose True False or 'auto' default Whether the algorithm should be applied to MT instead of M The result should approximately be the same The 'auto' mode will trigger the transposition if Mshape1 Mshape0 since this implementation of randomized SVD tend to be a little faster in that case

Changed in version 018

flipsign boolean True by default The output of a singular value decomposition is only unique up to a permutation of the signs of the singular vectors If flipsign is set to True the sign ambiguity is resolved by making the largest loadings for each component in the left singular vectors positive

randomstate int RandomState instance or None optional defaultNone The seed of the pseudo random number generator to use when shuffling the data If int randomstate is the seed used by the random number generator If RandomState instance randomstate is the random number generator If None the random number generator is the RandomState instance used by nprandom

Notes

This algorithm finds a usually very good approximate truncated singular value decomposition using random ization to speed up the computations It is particularly fast on large matrices on which you wish to extract only a small number of components In order to obtain further speed up niter can be set 2 at the cost of loss of precision

63917sklearnutilsextmath fastlogdet
sklearnutilsextmath fastlogdet A
Compute logdetA for A symmetric
Equivalent to nplogndetA but more robust It returns Inf if detA is non positive or is not defined
Parameters
Arraylike The matrix

63918sklearnutilsextmath density
sklearnutilsextmath densitywkwargs
Compute density of a sparse vector
Parameters
warraylike The sparse vector
Returns
float The density of w between 0 and 1

Examples using sklearnutilsextmathdensity

- Classification of text documents using sparse features

63919sklearnutilsextmath weightedmode
sklearnutilsextmath weightedmode aaxis0
Returns an array of the weighted modal most common value in a
If there is more than one such value only the first is returned The bincount for the modal bins is also returned
This is an extension of the algorithm in scipystatsmode
Parameters
aarraylike ndimensional array of which to find modes
warraylike ndimensional array of weights for each value
axis int optional Axis along which to operate Default is 0 ie the first axis
Returns
vals ndarray Array of modal values
score ndarray Array of weighted counts for each mode

array2 array35
```

The value 2 has the highest score it appears twice with weights of 15 and 2 the sum of these is 35

63920sklearnutils genevenslices

sklearnutils genevenslices npacks nsamplesNone

Generator to create npacks slices going up to n

Parameters

nint

npacks int Number of slices to generate

nsamples int or None default None Number of samples Pass nsamples when the slices

are to be used for sparse matrix indexing slicing offtheend raises an exception while it

works for NumPy arrays

Yields

slice

Examples

```
from sklearnutils import genevenslices
```

```
listgenevenslices10 1
```

```
slice0 10 None
```

```

```

63921sklearnutilsgraph singlesourceshortestpathlength

sklearnutilsgraph singlesourceshortestpathlength graph source cut

offNone

Return the shortest path length from source to all reachable nodes

Returns a dictionary of shortest path lengths keyed by target

Parameters

graph sparse matrix or 2D array preferably LIL matrix Adjacency matrix of the graph

2370 Chapter 6 API (Application Programming Interface) Reference

scikitlearn user guide Release 0213

source integer Starting node for path

cutoff integer optional Depth to stop the search only paths of length cutoff are returned

Examples

```
from sklearnutilsgraph import singlesourceshortestpathlength
```

```
import numpy as np
```

```
graph nparray 0 1 0 0
```

```
1 0 1 0
```

```
0 1 0 1
```

```
0 0 1 0

```

```
0 1 1 1 2 0 3 1 4 1 5 1
```

```
63922sklearnutilsgraphshortestpath graphshortestpath
```

```
sklearnutilsgraphshortestpath graphshortestpath
```

Perform a shortestpath graph search on a positive directed or undirected graph

Parameters

distmatrix arraylike or sparse matrix shape NN Array of positive distances If vertex

i is connected to vertex j then distmatrixij gives the distance between the vertices If

vertex i is not connected to vertex j then distmatrixij 0

directed boolean if True then find the shortest path on a directed graph only progress from

a point to its neighbors not the other way around if False then find the shortest path on an

undirected graph the algorithm can progress from a point to its neighbors and vice versa

method string 'auto''FW''D' method to use Options are 'auto' attempt to choose the best

method for the current problem 'FW' FloydWarshall algorithm ON3 'D' Dijkstra's

algorithm with Fibonacci stacks OKlogNN2

Returns

Gnpndarray float shape NN Gij gives the shortest distance from point i to point j

along the graph

Notes

As currently implemented Dijkstra's algorithm does not work for graphs with directiondependent distances

when directed False ie if distmatrixij and distmatrixji are not equal and both are nonzero

method'D' will not necessarily yield the correct result

Also these routines have not been tested for graphs with negative distances Negative distances can lead to

infinite cycles that must be handled by specialized algorithms

63923sklearnutils indexable

sklearnutils indexable iterables

Make arrays indexable for crossvalidation

639sklearnutils Utilities 2371

scikitlearn user guide Release 0213

Checks consistent length passes through None and ensures that everything can be indexed by converting sparse matrices to csr and converting noniterable objects to arrays

Parameters

iterables lists dataframes arrays sparse matrices List of objects to ensure sliceability

63924sklearnutilsmetaestimators ifdelegatehasmethod

sklearnutilsmetaestimators ifdelegatehasmethod delegate

Create a decorator for methods that are delegated to a subestimator

This enables ducktyping by hasattr returning True according to the subestimator

Parameters

delegate string list of strings or tuple of strings Name of the subestimator that can be accessed as an attribute of the base object If a list or a tuple of names are provided the first subestimator that is an attribute of the base object will be used

Examples using sklearnutilsmetaestimatorsifdelegatehasmethod

- Inductive Clustering

63925sklearnutilsmulticlass typeoftarget y

sklearnutilsmulticlass typeoftarget y

Determine the type of data indicated by the target

Note that this type is the most specific type that can be inferred For example

- binary is more specific but compatible with multiclass
- multiclass of integers is more specific but compatible with continuous
- multilabelindicator is more specific but compatible with multiclassmultioutput

Parameters

yarraylike

Returns

targettype string One of

- ‘continuous’ yis an arraylike of floats that are not all integers and is 1d or a column vector
- ‘continuousmultioutput’ yis a 2d array of floats that are not all integers and both dimensions are of size 1
- ‘binary’ ycontains 2 discrete values and is 1d or a column vector
- ‘multiclass’ ycontains more than two discrete values is not a sequence of sequences and is 1d or a column vector
- ‘multiclassmultioutput’ yis a 2d array that contains more than two discrete values is not a sequence of sequences and both dimensions are of size 1
- ‘multilabelindicator’ yis a label indicator matrix an array of two dimensions with at least two columns and at most 2 unique values

2372 Chapter 6 API (Application Programming Interface) Reference

scikitlearn user guide Release 0213

- ‘unknown’ yis arraylike but none of the above such as a 3d array sequence of sequences or an array of nonsequence objects

Examples

```
import numpy as np
typeoftarget01 06
continuous
typeoftarget1 1 1 1
binary
typeoftargeta b a
binary
typeoftarget10 20
binary
typeoftarget1 0 2
multiclass
typeoftarget10 00 30
multiclass
typeoftargeta b c
multiclass
typeoftargetnparray1 2 3 1
multiclassmultioutput
typeoftarget1 2
multiclassmultioutput
typeoftargetnparray15 20 30 16
continuousmultioutput
typeoftargetnparray0 1 1 1
multilabelindicator
63926sklearnutilsmulticlass ismultilabel
sklearnutilsmulticlass ismultilabel y
```

Check ifyis in a multilabel format

Parameters

ynumpy array of shape nsamples Target values

Returns

out bool Return True ifyis in a multilabel format else False

Examples

```
import numpy as np
from sklearnutilsmulticlass import ismultilabel
ismultilabel0 1 0 1
False
ismultilabel1 0 2
False
ismultilabelnparray1 0 0 0
True
ismultilabelnparray1 0 0
False
639sklearnutils Utilities 2373
```

scikitlearn user guide Release 0213

ismultilabelInparray1 0 0

True

63927sklearnutilsmulticlass uniquelabels

sklearnutilsmulticlass uniquelabels ys

Extract an ordered array of unique labels

We don't allow

- mix of multilabel and multiclass single label targets
- mix of label indicator matrix and anything else because there are no explicit labels
- mix of label indicator matrices of different sizes
- mix of string and integer labels

At the moment we also don't allow "multiclassmultioutput" input type

Parameters

ys arraylikes

Returns

out numpy array of shape nuniquelabels An ordered array of unique labels

Examples

from sklearnutilsmulticlass import uniquelabels

uniquelabels3 5 5 5 7 7

array3 5 7

uniquelabels1 2 3 4 2 2 3 4

array1 2 3 4

uniquelabels1 2 10 5 11

array 1 2 5 10 11

Examples using sklearnutilsmulticlassuniquelabels

•Confusion matrix

63928sklearnutils murmurhash332

sklearnutils murmurhash332

Compute the 32bit murmurhash3 of key at seed

The underlying implementation is MurmurHash3x8632 generating low latency 32bits hash suitable for im

plementing lookup tables Bloom filters count min sketch or feature hashing

Parameters

key int32 bytes unicode or ndarray with dtype int32 the physical object to hash

seed int optional default is 0 integer seed for the hashing algorithm

positive boolean optional default is False

2374 Chapter 6 API (Application Programming Interface) Reference

scikitlearn user guide Release 0213

True the results is casted to an unsigned int from 0 to 2³² - 1

False the results is casted to a signed int from 2³¹ to 2³¹ - 1

63929sklearnutils resample

sklearnutils resample arrays options

Resample arrays or sparse matrices in a consistent way

The default strategy implements one step of the bootstrapping procedure

Parameters

arrays sequence of indexable datastructures Indexable datastructures can be arrays lists

dataframes or scipy sparse matrices with consistent first dimension

Returns

resampledarrays sequence of indexable datastructures Sequence of resampled copies of

the collections The original arrays are not impacted

Other Parameters

replace boolean True by default Implements resampling with replacement If False this will implement sliced random permutations

nsamples int None by default Number of samples to generate If left to None this is automatically set to the first dimension of the arrays If replace is False it should not be larger than the length of arrays

randomstate int RandomState instance or None optional defaultNone The seed of the pseudo random number generator to use when shuffling the data If int randomstate is the seed used by the random number generator If RandomState instance randomstate is the random number generator If None the random number generator is the RandomState instance used by nprandom

stratify arraylike or None defaultNone If not None data is split in a stratified fashion using this as the class labels

63930sklearnutils safeindexing

sklearnutils safeindexing Xindices

Return items or rows from X using indices

Allows simple indexing of lists or arrays

Parameters

Xarraylike sparsematrix list pandasDataFrame pandasSeries Data from which to sam

ple rows or items

indices arraylike of int Indices according to which X will be subsampled

Returns

subset Subset of X on first axis

Notes

CSR (Compressed Sparse Row) CSC and LIL sparse matrices are supported COO sparse matrices are not supported

63931sklearnutils safemask

sklearnutils safemask Xmask

Return a mask which is safe to use on X

Parameters

Xarraylike sparse matrix Data on which to apply mask

mask array Mask to be used on X

Returns

2376 Chapter 6 API (Application Programming Interface) Reference

scikitlearn user guide Release 0213

mask

63932sklearnutils safesqr

sklearnutils safesqr XcopyTrue

Element wise squaring of arraylikes and sparse matrices

Parameters

Xarray like matrix sparse matrix

copy boolean optional default True Whether to create a copy of X and operate on it or to

perform inplace computation default behaviour

Returns

X 2 element wise square

63933sklearnutils shuffle

sklearnutils shufflearrays options

Shuffle arrays or sparse matrices in a consistent way

This is a convenience alias to resample arrays replaceFalse to do random permutations of the collections

Parameters

arrays sequence of indexable datastructures Indexable datastructures can be arrays lists

dataframes or scipy sparse matrices with consistent first dimension

Returns

shuffledarrays sequence of indexable datastructures Sequence of shuffled copies of the col

lections The original arrays are not impacted

Other Parameters

randomstate int RandomState instance or None optional defaultNone The seed of the pseudo random number generator to use when shuffling the data If int randomstate is the seed used by the random number generator If RandomState instance randomstate is the random number generator If None the random number generator is the RandomState instance used by nprandom

nsamples int None by default Number of samples to generate If left to None this is automatically set to the first dimension of the arrays

- Early stopping of Stochastic Gradient Descent

63934sklearnutilssparsefuncs incrmearvarianceaxis

sklearnutilssparsefuncs incrmearvarianceaxis Xaxislastmean lastvar lastn

Compute incremental mean and variance along an axix on a CSR (Compressed Sparse Row) or CSC matrix
lastmean lastvar are the statistics computed at the last step by this function Both must be initialized to 0
arrays of the proper size ie the number of features in X lastn is the number of samples encountered until
now

Parameters

XCSR or CSC sparse matrix shape nsamples nfeatures Input data

axis int either 0 or 1 Axis along which the axis should be computed

lastmean float array with shape nfeatures Array of featurewise means to update with the
new data X

2378 Chapter 6 API (Application Programming Interface) Reference

scikitlearn user guide Release 0213

lastvar float array with shape nfeatures Array of featurewise var to update with the new data X

lastn int with shape nfeatures Number of samples seen so far excluded X

Returns

means float array with shape nfeatures Updated featurewise means

variances float array with shape nfeatures Updated featurewise variances

nint with shape nfeatures Updated number of seen samples

Notes

NaNs are ignored in the algorithm

63935sklearnutilssparsefuncs inplacecolumnscale

sklearnutilssparsefuncs inplacecolumnscale Xscale

Inplace column scaling of a CSCCSR matrix

Scale each feature of the data matrix by multiplying with specific scale provided by the caller assuming a

nsamples nfeatures shape

Parameters

XCSC or CSR (Compressed Sparse Row) matrix with shape nsamples nfeatures Matrix to normalize using the variance of the features

scale float array with shape nfeatures Array of precomputed featurewise values to use for

scaling

63936sklearnutilssparsefuncs inplacerowscale

sklearnutilssparsefuncs inplacerowscale Xscale

Inplace row scaling of a CSR (Compressed Sparse Row) or CSC matrix

Scale each row of the data matrix by multiplying with specific scale provided by the caller assuming a

nsamples nfeatures shape

Parameters

XCSR or CSC sparse matrix shape nsamples nfeatures Matrix to be scaled

scale float array with shape nfeatures Array of precomputed samplewise values to use for

scaling

63937sklearnutilssparsefuncs inplaceswaprow

sklearnutilssparsefuncs inplaceswaprow Xmn

Swaps two rows of a CSCCSR matrix inplace

Parameters

XCSR or CSC sparse matrix shapensamples nfeatures Matrix whose two rows are to

be swapped

639sklearnutils Utilities 2379

scikitlearn user guide Release 0213

mint Index of the row of X to be swapped

nint Index of the row of X to be swapped

63938sklearnutilssparsfuncs inplacecolumn

sklearnutilssparsfuncs inplacecolumn Xmn

Swaps two columns of a CSCCSR matrix inplace

Parameters

XCSR or CSC sparse matrix shapensamples nfeatures Matrix whose two columns are

to be swapped

mint Index of the column of X to be swapped

nint Index of the column of X to be swapped

63939sklearnutilssparsfuncs meanvarianceaxis

sklearnutilssparsfuncs meanvarianceaxis Xaxis

Compute mean and variance along an axis on a CSR (Compressed Sparse Row) or CSC matrix

Parameters

XCSR or CSC sparse matrix shape nsamples nfeatures Input data

axis int either 0 or 1 Axis along which the axis should be computed

Returns

means float array with shape nfeatures Featurewise means

variances float array with shape nfeatures Featurewise variances

63940sklearnutilssparsfuncs inplacecolumnscale

sklearnutilssparsfuncs inplacecolumnscale Xscale

Inplace column scaling of a CSR (Compressed Sparse Row) matrix

Scale each feature of the data matrix by multiplying with specific scale provided by the caller assuming a

nsamples nfeatures shape

Parameters

XCSR matrix with shape nsamples nfeatures Matrix to normalize using the variance of

the features

scale float array with shape nfeatures Array of precomputed featurewise values to use for

scaling

63941sklearnutilssparsfuncsfast inplacecolumnnormalizel1

sklearnutilssparsfuncsfast inplacecolumnnormalizel1

2380 Chapter 6 API (Application Programming Interface) Reference

scikitlearn user guide Release 0213

63942sklearnutilssparsefuncsfast inplacecsrrownormalizel2

sklearnutilssparsefuncsfast inplacecsrrownormalizel2

Inplace row normalize using the l2 norm

63943sklearnutilsrandom samplewithoutreplacement

sklearnutilsrandom samplewithoutreplacement

Sample integers without replacement

Select nsamples integers from the set 0 npopulation without replacement

Parameters

npopulation int The size of the set to sample from

nsamples int The number of integer to sample

randomstate int RandomState instance or None optional defaultNone If int ran

domstate is the seed used by the random number generator If RandomState instance

randomstate is the random number generator If None the random number generator is

the RandomState instance used by nprandom

method "auto" "trackingselection" "reservoirsampling" or "pool" If method "auto"

the ratio of nsamples npopulation is used to determine which algorithm to use If ra

tio is between 0 and 001 tracking selection is used If ratio is between 001 and 099

numpyrandompermutation is used If ratio is greater than 099 reservoir sampling is used

The order of the selected integers is undefined If a random order is desired the selected

subset should be shuffled

If method "trackingselection" a set based implementation is used which is suitable for

nsamples npopulation

If method "reservoirsampling" a reservoir sampling algorithm is used which is suitable

for high memory constraint or when O nsamples Onpopulation The order of the

selected integers is undefined If a random order is desired the selected subset should be

shuffled

If method "pool" a pool based algorithm is particularly fast even faster than the tracking

selection method However a vector containing the entire population has to be initialized

If nsamples npopulation the reservoir sampling method is faster

Returns

out array of size nsamples The sampled subsets of integer The subset of selected integer

might not be randomized see the method argument

63944sklearnutilvalidation checkisfitted

sklearnutilvalidation checkisfitted estimator attributes msgNone

alloranybuiltin function all

Perform isfitted validation for estimator

Checks if the estimator is fitted by verifying the presence of "allorany" of the passed attributes and raises a

NotFittedError with the given message

Parameters

estimator estimator instance estimator instance for which the check is performed

639sklearnutils Utilities 2381

scikitlearn user guide Release 0213

attributes attribute names given as string or a listtuple of strings

Egcoef estimator coef

msg string The default error message is “This names instance is not fitted yet Call ‘fit’ with appropriate arguments before using this method”

For custom messages if “names” is present in the message string it is substituted for the estimator name

Eg “Estimator names must be fitted before sparsifying”

allorany callable all any default all Specify whether all or any of the given attributes must exist

Returns

None

Raises

NotFittedError If the attributes are not found

63945sklearnutilsvalidation checkmemory

sklearnutilsvalidation checkmemory memory

Check that memory is joblibMemorylike

joblibMemorylike means that memory can be converted into a joblibMemory instance typically a str denoting thelocation or has the same interface has a cache method

Parameters

memory None str or object with the joblibMemory interface

Returns

memory object with the joblibMemory interface

Raises

ValueError Ifmemory is not joblibMemorylike

63946sklearnutilsvalidation checksymmetric

sklearnutilsvalidation checksymmetric array tol1e10 raisewarningTrue

raiseexceptionFalse

Make sure that array is 2D square and symmetric

If the array is not symmetric then a symmetrized version is returned Optionally a warning or exception is raised if the matrix is not symmetric

Parameters

array ndarray or sparse matrix Input object to check convert Must be twodimensional and square otherwise a ValueError will be raised

tolfloat Absolute tolerance for equivalence of arrays Default 1E10

raisewarning boolean defaultTrue If True then raise a warning if conversion is required

raiseexception boolean defaultFalse If True then raise an exception if array is not sym
metric

2382 Chapter 6 API (Application Programming Interface) Reference

scikitlearn user guide Release 0213

Returns
arraysym ndarray or sparse matrix Symmetrized version of the input array ie the average of array and arraytranspose If sparse then duplicate entries are first summed and zeros are eliminated

63947sklearnutilvalidation columnnor1d
sklearnutilvalidation columnnor1d ywarnFalse
Ravel column or 1d numpy array else raises an error

Parameters
yarraylike
warn boolean default False To control display of warnings

Returns
yarray
63948sklearnutilvalidation hasfitparameter
sklearnutilvalidation hasfitparameter estimator parameter
Checks whether the estimator’s fit method supports the given parameter

Parameters
estimator object An estimator to inspect
parameter str The searched parameter
Returns
isparameter bool Whether the parameter was found to be a named parameter of the estimator’s fit method

Examples
from sklearnsvm import SVC (Support Vector Classification)
hasfitparameterSVC sampleweight
True

63949sklearnutiltesting assertin

scikitlearn user guide Release 0213

63951sklearnutilstesting assertraisemessage

sklearnutilstesting assertraisemessage exceptions message function args
kwargs

Helper function to test the message raised in an exception

Given an exception a callable to raise the exception and a message string tests that the correct exception is raised and that the message is a substring of the error thrown Used to test that the specific message thrown during an exception is correct

Parameters

exceptions exception or tuple of exception An Exception object

message str The error message or a substring of the error message

function callable Callable object to raise error

args the positional arguments to function

kwargs the keyword arguments to function

63952sklearnutilstesting allestimators

sklearnutilstesting allestimators includemetaestimatorsNone includeootherNone

typefilterNone includedonttestNone

Get a list of all estimators from sklearn

This function crawls the module and gets all classes that inherit from BaseEstimator Classes that are defined in

testmodules are not included By default metaestimators such as GridSearchCV are also not included

Parameters

includemetaestimators boolean defaultFalse Deprecated ignored deprecated 021

includemetaestimators has been deprecated and has no effect in 021 and
will be removed in 023

includeoother boolean defaultFalse Deprecated ignored deprecated 021

includeoother has been deprecated and has not effect in 021 and will be removed
in 023

typefilter string list of string or None defaultNone Which kind of estimators should be

returned If None no filter is applied and all estimators are returned Possible values are

‘classifier’ ‘regressor’ ‘cluster’ and ‘transformer’ to get estimators only of these specific
types or a list of these to get the estimators that fit at least one of the types

includedonttest boolean defaultFalse Deprecated ignored deprecated 021

includedonttest has been deprecated and has no effect in 021 and will be
removed in 023

Returns

estimators list of tuples List of name class where name is the class name as string and

class is the actual type of the class

Utilities from joblib

2384 Chapter 6 API (Application Programming Interface) Reference

scikitlearn user guide Release 0213

utilsparallelbackend backend njobs Change the default backend used by Parallel inside a with block

utilsregisterparallelbackend name fac

Register a new Parallel backend factory

sklearnutils parallelbackend

sklearnutils parallelbackend backend njobs1 backendparams

Change the default backend used by Parallel inside a with block

If backend is a string it must match a previously registered implementation using the registerparallelbackend function

By default the following backends are available

- ‘loky’ singlehost processbased parallelism used by default
- ‘threading’ singlehost threadbased parallelism
- ‘multiprocessing’ legacy singlehost processbased parallelism

‘loky’ is recommended to run functions that manipulate Python objects ‘threading’ is a lowoverhead alternative that is most efficient for functions that release the Global Interpreter Lock eg IObound code or CPUbound code in a few calls to native code that explicitly releases the GIL

In addition if the dask anddistributed Python packages are installed it is possible to use the ‘dask’ backend for better scheduling of nested parallel calls without oversubscription and potentially distribute parallel calls over a networked cluster of several hosts

Alternatively the backend can be passed directly as an instance

By default all available workers will be used njobs1 unless the caller passes an explicit value for the njobs parameter

This is an alternative to passing a backendbackendname argument to the Parallel class constructor

It is particularly useful when calling into library code that uses joblib internally but does not expose the backend argument in its own API (Application Programming Interface)

```
from operator import neg
with parallelbackendthreading
printParalleldelayednegi 1 foriinrange5
```

1 2 3 4 5

Warning this function is experimental and subject to change in a future version of joblib

New in version 010

sklearnutils registerparallelbackend

sklearnutils registerparallelbackend name factory makedefaultFalse

Register a new Parallel backend factory

The new backend can then be selected by passing its name as the backend argument to the Parallel class

Moreover the default backend can be overwritten globally by setting makedefaultTrue

The factory can be any callable that takes no argument and return an instance of ParallelBackendBase

Warning this function is experimental and subject to change in a future version of joblib

sklearnutils Utilities 2385

cacheselffuncNone ignoreNone verboseNone mmapmodeFalse

Decorates the given function func to only compute its return value for input arguments not cached on disk

Parameters

2386 Chapter 6 API (Application Programming Interface) Reference

scikitlearn user guide Release 0213

func callable optional The function to be decorated

ignore list of strings A list of arguments name to ignore in the hashing

verbose integer optional The verbosity mode of the function By default that of the memory object is used

mmapmode None 'r' 'r+' 'w' 'c' optional The memmapping mode used when loading from cache numpy arrays See numpyload for the meaning of the arguments

By default that of the memory object is used

Returns

decoratedfunc MemorizedFunc object The returned object is a MemorizedFunc object that is callable behaves like a function but offers extra methods for cache lookup and management See the documentation for joblibmemoryMemorizedFunc

clearselfwarnTrue

Erase the complete cache directory

evalselffuncargs kwargs

Eval function func with arguments args andkwargs in the context of the memory

This method works similarly to the builtin apply except that the function is called only if the cache is not up to date

formatselfobjindent0

Return the formatted representation of the object

reducesize self

Remove cache elements to make cache size fit in byteslimit

ality directly from joblib which can be installed with pip install joblib

dispatchnext self

Dispatch more data for parallel processing

This method is meant to be called concurrently by the multiprocessing callback We rely on the thread safety of dispatchonebatch to protect against concurrent consumption of the unprotected iterator

dispatchonebatch selfiterator

Prefetch the tasks for the next batch and dispatch them

The effective size of the batch is computed here If there are no more jobs to dispatch return False else return True

The iterator consumption and dispatching is protected by the same lock so calling this function should be thread safe

formatselfobjindent0

Return the formatted representation of the object

printprogress self

Display the progress of the parallel execution only a fraction of time controlled by selfverbose

sklearnmetrics jaccardsimilarityscore

Warning DEPRECATED

sklearnmetrics jaccardsimilarityscore ytrue ypred normalizeTrue sampleweightNone

Jaccard similarity coefficient score

Deprecated since version 021 This is deprecated to be removed in 023 since its handling of binary and multiclass inputs was broken jaccardscore has an API (Application Programming Interface) that is consistent with precisionscore fscore etc

Read more in the User Guide

Parameters

ytrue 1d arraylike or label indicator array sparse matrix Ground truth correct labels

ypred 1d arraylike or label indicator array sparse matrix Predicted labels as returned by a classifier

normalize bool optional defaultTrue If False return the sum of the Jaccard similarity coefficient over the sample set Otherwise return the average of Jaccard similarity coefficient

sampleweight arraylike of shape nsamples optional Sample weights

Returns

score float Ifnormalize True return the average Jaccard similarity coefficient else it returns the sum of the Jaccard similarity coefficient over the sample set

The best performance is 1 with normalize True and the number of samples with normalize False

See also

accuracy score hammingloss zeroone loss

Notes

In binary and multiclass classification this function is equivalent to the accuracy score It differs in the multilabel classification problem

DEPRECATED logisticregressionpath was deprecated in version 021 and will be removed in version 0230

Compute a Logistic Regression model for a list of regularization parameters

This is an implementation that uses the result of the previous model to speed up computations along the

set of solutions making it faster than sequentially calling LogisticRegression for the different parameters

Note that there will be no speedup with liblinear solver since it does not handle warmstarting

Deprecated since version 021 logisticregressionpath was deprecated in version 021 and

will be removed in 023

Read more in the User Guide

Parameters

Xarraylike or sparse matrix shape nsamples nfeatures

Input data

yarraylike shape nsamples or nsamples ntargets Input data target values

posclass int None The class with respect to which we perform a onevsall fit If None

then it is assumed that the given problem is binary

Csint arraylike shape ncs List of values for the regularization parameter or integer

specifying the number of regularization parameters that should be used In this case the

parameters will be chosen in a logarithmic scale between 1e4 and 1e4

fitintercept bool Whether to fit an intercept for the model In this case the shape of the

returned array is ncs nfeatures 1

maxiter int Maximum number of iterations for the solver

tolfloat Stopping criterion For the newtoncg and lbfgs solvers the iteration will stop

whenmaxgi i 1 n tol wheregi is the ith component

of the gradient

verbose int For the liblinear and lbfgs solvers set verbose to any positive number for

verbosity

solver 'lbfgs' 'newtoncg' 'liblinear' 'sag' 'saga' Numerical solver to use

scikitlearn user guide Release 0213

coef arraylike shape nfeatures default None Initialization value for coefficients of logistic regression Useless for liblinear solver

classweight dict or 'balanced' optional Weights associated with classes in the form classlabel weight If not given all classes are supposed to have weight one

The "balanced" mode uses the values of y to automatically adjust weights inversely proportional to class frequencies in the input data as nsamples nclasses npbincount

Note that these weights will be multiplied with sampleweight passed through the fit method if sampleweight is specified

dual bool Dual or primal formulation Dual formulation is only implemented for l2 penalty with liblinear solver Prefer dualFalse when nsamples nfeatures

penalty str 'l1' 'l2' or 'elasticnet' Used to specify the norm used in the penalization The 'newtoncg' 'sag' and 'lbfgs' solvers support only l2 penalties 'elasticnet' is only supported by the 'saga' solver

interceptscaling float default 1 Useful only when the solver 'liblinear' is used and selffitintercept is set to True In this case x becomes x selfinterceptscaling

ie a "synthetic" feature with constant value equal to interceptscaling is appended to the instance vector The intercept becomes interceptscaling syntheticfeatureweight

Note the synthetic feature weight is subject to l1l2 regularization as all other features To lessen the effect of regularization on synthetic feature weight and therefore on the intercept interceptscaling has to be increased

multiclass str 'ovr' 'multinomial' 'auto' default 'ovr' If the option chosen is 'ovr' then a binary problem is fit for each label For 'multinomial' the loss minimised is the multinomial loss fit across the entire probability distribution even when the data is binary 'multinomial' is unavailable when solver'liblinear' 'auto' selects 'ovr' if the data is binary or if solver'liblinear' and otherwise selects 'multinomial'

New in version 018 Stochastic Average Gradient descent solver for 'multinomial' case Changed in version 020 Default will change from 'ovr' to 'auto' in 022

randomstate int RandomState instance or None optional default None The seed of the pseudo random number generator to use when shuffling the data If int randomstate is the seed used by the random number generator If RandomState instance randomstate is the random number generator If None the random number generator is the RandomState instance used by nprandom Used when solver 'sag' or 'liblinear'

checkinput bool default True If False the input arrays X and y will not be checked maxsquaredsum float default None Maximum squared sum of X over samples Used only in SAG solver If None it will be computed going through all the samples The value should be precomputed to speed up cross validation

sampleweight arraylike shapensamples optional Array of weights that are assigned to individual samples If not provided then each sample is given unit weight

l1ratio float or None optional defaultNone The ElasticNet mixing parameter with0 l1ratio 1 Only used if penaltyelasticnet Setting l1ratio0 is equivalent to using penaltyl2 while setting l1ratio1 is equivalent to using penaltyl1 For0 l1ratio 1 the penalty is a combination of L1 and L2

640 Recently deprecated 2391

scikitlearn user guide Release 0213

Returns

coefs ndarray shape ncs nfeatures or ncs nfeatures 1
List of coefficients for the Logistic Regression model If fitintercept is set to True
then the second dimension will be nfeatures 1 where the last item represents
the intercept For multiclassmultinomial the shape is nclasses ncs
nfeatures or nclasses ncs nfeatures 1
Csndarray Grid of Cs used for crossvalidation
niter array shape ncs Actual number of iteration for each Cs

Notes

You might get slightly different results with the solver liblinear than with the others since this uses LIBLINEAR
which penalizes the intercept

Deprecated since version 021 This function was deprecated in version 021 in favor of sklearn inspectionplotpartialdependence and will be removed in 023

Parameters

gbrt BaseGradientBoosting

A fitted gradient boosting model

Xarraylike shapensamples nfeatures The data on which gbrt was trained

features seq of ints strings or tuples of ints or strings If seqi is an int or a tuple with one int value a oneway PDP is created if seqi is a tuple of two ints a two way PDP is created If featurenames is specified and seqi is an int seqi must be lenfeaturenames If seqi is a string featurenames must be specified and seqi must be in featurenames

featurenames seq of str Name of each feature featurenamesi holds the name of the feature with index i

label object The class label for which the PDPs should be computed Only if gbrt is a multiclass model Must be in gbrtclasses

ncols int The number of columns in the grid plot default 3

gridresolution int default100 The number of equally spaced points on the axes

percentiles low high default005 095 The lower and upper percentile used to create the extreme values for the PDP axes

njobs int or None optional defaultNone None means 1 unless in a joblib parallelbackend context1means using all processors See Glossary for more details

verbose int Verbose output during PD computations Defaults to 0

axMatplotlib axis object default None An axis object onto which the plots will be drawn

linekw dict Dict with keywords passed to the matplotlib.pyplot.plot call For oneway partial dependence plots

contourkw dict Dict with keywords passed to the matplotlib.pyplot.plot call For twoway partial dependence plots

figkw dict Dict with keywords passed to the figure call Note that all keywords not recognized above will be automatically included here

Returns

figfigure

The Matplotlib Figure object

axs seq of Axis objects A seq of Axis objects one for each subplot

Examples

```
from sklearn.datasets import makefriedman1
from sklearn.ensemble import GradientBoostingRegressor
X y = makefriedman1
clf = GradientBoostingRegressor(n_estimators=10)
clf.fit(X y)

Get parameters for this estimator

2396 Chapter 6 API (Application Programming Interface) Reference

scikitlearn user guide Release 0213

Parameters

deep boolean optional If True will return the parameters for this estimator and contained subobjects that are estimators

Returns

params mapping of string to any Parameter names mapped to their values

getprecision self

Getter for the precision matrix

Returns

precision arraylike The precision matrix associated to the current covariance object

mahalanobis selfX

Computes the squared Mahalanobis distances of given observations

Parameters

Xarraylike shape nsamples nfeatures The observations the Mahalanobis distances of the which we compute Observations are assumed to be drawn from the same distribution than the data used in fit

Returns

dist array shape nsamples Squared Mahalanobis distances of the observations

scoreselfXtest yNone

Computes the loglikelihood of a Gaussian data set with selfcovariance as an estimator of its covariance matrix

Parameters

Xtest arraylike shape nsamples nfeatures Test data of which we compute the likelihood where nsamples is the number of samples and nfeatures is the number of features Xtest is assumed to be drawn from the same distribution than the data used in fit including centering

y not used present for API (Application Programming Interface) consistence purpose

Returns

resfloat The likelihood of the data set with selfcovariance as an estimator of its covariance matrix

setparams selfparams

Set the parameters of this estimator

The method works on simple estimators as well as on nested objects such as pipelines The latter have parameters of the form componentparameter so that it's possible to update each component of a nested object

Returns

self

alpha float Penalization parameter selected

cvalphas list of float All penalization parameters explored

gridscores 2D numpyndarray nalphas nfolds Loglikelihood score on leftout data

across folds

niter int Number of iterations run for the optimal alpha

See also

graphlasso GraphLasso

Notes

The search for the optimal penalization parameter alpha is done on an iteratively refined grid first the cross validated scores on a grid are computed then a new refined grid is centered around the maximum and so on One of the challenges which is faced here is that the solvers can fail to converge to a wellconditioned estimate The corresponding values of alpha then come out as missing values but the optimum may be close to these missing values

default the squared error norm is returned If False the error norm is returned

Returns

The Mean Squared Error in the sense of the Frobenius norm between

self andcompcov covariance estimators

fitselfXyNone

Fits the GraphicalLasso covariance model to X

Parameters

Xndarray shape nsamples nfeatures Data from which to compute the covariance es

timate

yignored

getparams selfdeepTrue

Get parameters for this estimator

Parameters

deep boolean optional If True will return the parameters for this estimator and contained

subobjects that are estimators

Returns

params mapping of string to any Parameter names mapped to their values

getprecision self

Getter for the precision matrix

Returns

precision arraylike The precision matrix associated to the current covariance object

mahalanobis selfX

Computes the squared Mahalanobis distances of given observations

Parameters

Xarraylike shape nsamples nfeatures The observations the Mahalanobis distances

of the which we compute Observations are assumed to be drawn from the same distribu

tion than the data used in fit

Returns

dist array shape nsamples Squared Mahalanobis distances of the observations

scoreselfXtest yNone

Computes the loglikelihood of a Gaussian data set with selfcovariance as an estimator of its

covariance matrix

Parameters

Xtest arraylike shape nsamples nfeatures Test data of which we compute the

likelihood where nsamples is the number of samples and nfeatures is the number of

features Xtest is assumed to be drawn from the same distribution than the data used in

fit including centering

ynot used present for API (Application Programming Interface) consistence purpose

Returns

resfloat The likelihood of the data set with selfcovariance as an estimator of its

covariance matrix

2400 Chapter 6 API (Application Programming Interface) Reference

scikitlearn user guide Release 0213

setparams selfparams

Set the parameters of this estimator

The method works on simple estimators as well as on nested objects such as pipelines The latter have parameters of the form componentparameter so that it’s possible to update each component of a nested object

Returns

self

sklearnpreprocessing Imputer

Warning DEPRECATED

classsklearnpreprocessing Imputerargs kwargs

Imputation transformer for completing missing values

Read more in the User Guide

Parameters

missingvalues integer or “NaN” optional default“NaN” The placeholder for the missing values All occurrences of missingvalues will be imputed For missing values

encoded as npnan use the string value “NaN”

strategy string optional default“mean” The imputation strategy

- If “mean” then replace missing values using the mean along the axis
 - If “median” then replace missing values using the median along the axis
 - If “mostfrequent” then replace missing using the most frequent value along the axis
- axis integer optional default0 The axis along which to impute

• Ifaxis0 then impute along columns

• Ifaxis1 then impute along rows

verbose integer optional default0 Controls the verbosity of the imputer

copy boolean optional defaultTrue If True a copy of X will be created If False imputation will be done inplace whenever possible Note that in the following cases a new copy will always be made even if copyFalse

- If X is not an array of floating values
- If X is sparse and missingvalues0
- Ifaxis0 and X is encoded as a CSR (Compressed Sparse Row) matrix
- Ifaxis1 and X is encoded as a CSC matrix

Attributes

statistics array of shape nfeatures The imputation fill value for each feature if axis 0
640 Recently deprecated 2401

Notes

- Whenaxis0 columns which only contained missing values at fit are discarded upon transform
- Whenaxis1 an exception is raised if there are rows for which it is not possible to fill in the missing values eg because they only contain missing values

Methods

fitself X y Fit the imputer on X

fittransform self X y Fit to data then transform it

getparams self deep Get parameters for this estimator

setparams self params Set the parameters of this estimator

transform self X Impute all missing values in X

init args kwargs

DEPRECATED Imputer was deprecated in version 020 and will be removed in 022 Import im

puteSimpleImputer from sklearn instead

fitselfXyNone

Fit the imputer on X

Parameters

Xarraylike sparse matrix shape nsamples nfeatures Input data where

nsamples is the number of samples and nfeatures is the number of features

Returns

self Imputer

fittransform selfXyNone fitparams

Fit to data then transform it

Fits transformer to X and y with optional parameters fitparams and returns a transformed version of X

Parameters

Xnumpy array of shape nsamples nfeatures Training set

ynumpy array of shape nsamples Target values

Returns

Xnew numpy array of shape nsamples nfeaturesnew Transformed array

getparams selfdeepTrue

Get parameters for this estimator

Parameters

deep boolean optional If True will return the parameters for this estimator and contained

subobjects that are estimators

Returns

params mapping of string to any Parameter names mapped to their values

setparams selfparams

Set the parameters of this estimator

scikitlearn user guide Release 0213

The method works on simple estimators as well as on nested objects such as pipelines The latter have parameters of the form componentparameter so that it's possible to update each component of a nested object

Returns

self

transform selfX

Impute all missing values in X

Parameters

Xarraylike sparse matrix shape nsamples nfeatures The input data to complete

sklearnutilstesting mockmldataurlopen

Warning DEPRECATED

classsklearnutilstesting mockmldataurlopen args kwargs

Object that mocks the urlopen function to fake requests to mldata

When requesting a dataset with a name that is in mockdatasets this object creates a fake dataset in a StringIO

object and returns it Otherwise it raises an HTTPError

Deprecated since version 020 Will be removed in version 022

Parameters

mockdatasets dict A dictionary of datasetname datadict or datasetname datadict

ordering datadict itself is a dictionary of columnname dataarray and

ordering is a list of columnnames to determine the ordering in the data set see

fakemldata for details

Methods

call self urlname

Parameters

init args kwargs

DEPRECATED deprecated in version 020 to be removed in version 022

DEPRECATED The 'graphlasso' was renamed to 'graphicallasso' in version 020 and will be removed in

022

l1penalized covariance estimator

Read more in the User Guide

Parameters

empcov 2D ndarray shape nfeatures nfeatures

Empirical covariance from which to compute the covariance estimate

alpha positive float The regularization parameter the higher alpha the more regularization the sparser the inverse covariance

covinit 2D array nfeatures nfeatures optional The initial guess for the covariance

mode 'cd' 'lars' The Lasso solver to use coordinate descent or LARS Use LARS

for very sparse underlying graphs where $p \gg n$ Elsewhere prefer cd which is more numerically stable

tol positive float optional The tolerance to declare convergence if the dual gap goes below this value iterations are stopped

enettol positive float optional The tolerance for the elastic net solver used to calculate the descent direction This parameter controls the accuracy of the search direction for a given column update not of the overall parameter estimate Only used for mode'cd'

maxiter integer optional The maximum number of iterations

verbose boolean optional If verbose is True the objective function and dual gap are printed at each iteration

returncosts boolean optional If returncosts is True the objective function and dual gap at each iteration are returned

eps float optional The machineprecision regularization in the computation of the Cholesky diagonal factors Increase this for very illconditioned systems

turnniter bool optional Whether or not to return the number of iterations

Returns

covariance 2D ndarray shape nfeatures nfeatures

The estimated covariance matrix

precision 2D ndarray shape nfeatures nfeatures The estimated sparse precision matrix

2404 Chapter 6 API (Application Programming Interface) Reference

scikitlearn user guide Release 0213

costs list of objective dualgap pairs The list of values of the objective function and the

dual gap at each iteration Returned only if returncosts is True

niter int Number of iterations Returned only if returnniter is set to True

Notes

The algorithm employed to solve this problem is the GLasso algorithm from the Friedman 2008 Biostatistics paper It is the same algorithm as in the R glasso package

One possible difference with the glasso R package is that the diagonal coefficients are not penalized

sklearn.datasets.fetch_mldata

Warning DEPRECATED

sklearn.datasets.fetch_mldata dataname targetname'label' dataname'data' trans

posedata=True datahome=None

DEPRECATED fetch_mldata was deprecated in version 020 and will be removed in version 022 Please use

fetch_openml

Fetch an mldata.org data set

mldata.org is no longer operational

If the file does not exist yet it is downloaded from mldata.org

mldata.org does not have an enforced convention for storing data or naming the columns in a data

set The default behavior of this function works well with the most common cases

1 data values are stored in the column 'data' and target values in the column 'label'

2 alternatively the first column stores target values and the second data values

3 the data array is stored as nfeatures x nsamples and thus needs to be transposed to

match the sklearn standard

Keyword arguments allow to adapt these defaults to specific data sets see parameters

targetname dataname transposedata and the examples below

mldata.org data sets may have multiple columns which are stored in the Bunch object with their

original name

Deprecated since version 020 Will be removed in version 022

Parameters

dataname str

Name of the data set on mldata.org eg "leukemia" "Whistler Daily Snowfall" etc

The raw name is automatically converted to a mldata.org URL

targetname optional default 'label' Name or index of the column containing the target

values

dataname optional default 'data' Name or index of the column containing the data

transposedata optional default True If True transpose the downloaded data array

640 Recently deprecated 2405

scikitlearn user guide Release 0213

datahome optional default None Specify another download and cache folder for the data sets By default all scikitlearn data is stored in 'scikitlearndata' subfolders

Returns

data Bunch Dictionarylike object the interesting attributes are 'data' the data to learn 'target' the classification labels 'DESCR' the full description of the dataset and 'COLNAMES' the original names of the dataset columns

sklearn.datasets.mldatafilename

Warning DEPRECATED

sklearn.datasets.mldatafilename dataname

DEPRECATED mldatafilename was deprecated in version 020 and will be removed in version 022 Please use fetchopenml

Convert a raw name for a data set in a mldataorg filename

Deprecated since version 020 Will be removed in version 022

Parameters

dataname str Name of dataset

Returns

fname str The converted dataname

2406 Chapter 6 API (Application Programming Interface) Reference

CHAPTER
SEVEN
DEVELOPER’S GUIDE
71 Contributing

This project is a community effort and everyone is welcome to contribute
The project is hosted on <https://github.com/scikitlearn/scikitlearn>
The decision making process and governance structure of scikitlearn is laid out in the governance document [Scikit learn governance and decisionmaking](#)
Scikitlearn is somewhat selective when it comes to adding new algorithms and the best way to contribute and to help the project is to start working on known issues See [Issues for New Contributors](#) to get started
Our community our values
We are a community based on openness and friendly didactic discussions
We aspire to treat everybody equally and value their contributions
Decisions are made based on technical merit and consensus
Code is not the only way to help the project Reviewing pull requests answering questions to help others on mailing lists or issues organizing and teaching tutorials working on the website improving the documentation are all priceless contributions
We abide by the principles of openness respect and consideration of others of the Python Software Foundation <https://www.python.org/psf/codeofconduct>
In case you experience issues using this package do not hesitate to submit a ticket to the GitHub issue tracker You are also welcome to post feature requests or pull requests
711 Ways to contribute
There are many ways to contribute to scikitlearn with the most common ones being contribution of code or documentation to the project Improving the documentation is no less important than improving the library itself If you find a typo in the documentation or have made improvements do not hesitate to send an email to the mailing list or preferably submit a GitHub pull request Full documentation can be found under the doc directory
But there are many other ways to help In particular answering queries on the issue tracker investigating bugs and reviewing other developers’ pull requests are very valuable contributions that decrease the burden on the project maintainers
2407

scikitlearn user guide Release 0213

Another way to contribute is to report issues you’re facing and give a “thumbs up” on issues that others reported and that are relevant to you It also helps us if you spread the word reference the project from your blog and articles link to it from your website or simply star to say “I use it”

In case a contributionissue involves changes to the API (Application Programming Interface) principles or changes to dependencies or supported versions must be backed by a Enhancement proposals SLEPs where a SLEP must be submitted as a pullrequest to enhance the project. Enhancement proposals using the SLEP template and follows the decisionmaking process outlined in Scikitlearn governance and decisionmaking

Contributing to related projects

Scikitlearn thrives in an ecosystem of several related projects which also may have relevant issues to work on including smaller projects such as

- scikitlearncontrib
- joblib
- sphinxgallery
- numpydoc
- liacarff

and larger projects

- numpy
- scipy
- matplotlib
- and so on

Look for issues marked “help wanted” or similar Helping these projects may help Scikitlearn too See also Related Projects

712 Submitting a bug report or a feature request

We use GitHub issues to track all bugs and feature requests feel free to open an issue if you have found a bug or wish to see a feature implemented

In case you experience issues using this package do not hesitate to submit a ticket to the Bug Tracker You are also welcome to post feature requests or pull requests

It is recommended to check that your issue complies with the following rules before submitting

- Verify that your issue is not being currently addressed by other issues or pull requests
- If you are submitting an algorithm or feature request please verify that the algorithm fulfills our new algorithm requirements
- If you are submitting a bug report we strongly encourage you to follow the guidelines in How to make a good bug report

How to make a good bug report

When you submit an issue to Github please do your best to follow these guidelines This will make it a lot easier to provide you with good feedback

2408 Chapter 7 Developer’s Guide

scikitlearn user guide Release 0213

- The ideal bug report contains a short reproducible code snippet this way anyone can try to reproduce the bug easily see this for more details If your snippet is longer than around 50 lines please link to a gist or a github repo
- If not feasible to include a reproducible snippet please be specific about what estimators and/or functions are involved and the shape of the data
- If an exception is raised please provide the full traceback
- Please include your operating system type and version number as well as your Python scikitlearn numpy and scipy versions This information can be found by running the following code snippet

```
import sklearn
sklearn.show_versions
```

Note This utility function is only available in scikitlearn v0.20 For previous versions one has to explicitly run

```
import platform
print(platform.platform)
import sys
print(sys.version)
import numpy
print(numpy.__version__)
import scipy
print(scipy.__version__)
import sklearn
print(sklearn.__version__)
```

- Please ensure all code snippets and error messages are formatted in appropriate code blocks See Creating and highlighting code blocks for more details

7.1.3 Contributing code

Note To avoid duplicating work it is highly advised that you search through the issue tracker and the PR list If in doubt about duplicated work or if you want to work on a nontrivial feature it's recommended to first open an issue in the issue tracker to get some feedbacks from core developers

How to contribute

The preferred way to contribute to scikitlearn is to fork the main repository on GitHub then submit a "pull request" PR

- 1 Create an account on GitHub if you do not already have one
- 2 Fork the project repository click on the 'Fork' button near the top of the page This creates a copy of the code under your account on the GitHub user account For more details on how to fork a repository see this guide
- 3 Clone your fork of the scikitlearn repo from your GitHub account to your local disk

```
git clone git@github.com:YourLogin/scikitlearn.git
```

```
cd scikitlearn
```

- 4 Install the development dependencies

```
pip install cython pytest flake8
```

- 5 Install scikitlearn in editable mode

7.1.4 Contributing 2409

scikitlearn user guide Release 0213

pip install editable

for more details about advanced installation see the Building from source section

6 Add the upstream remote This saves a reference to the main scikitlearn repository which you can use to keep your repository synchronized with the latest changes

git remote add upstream <https://github.com/scikitlearn/scikitlearn.git>

7 Fetch the upstream and then create a branch to hold your development changes

git fetch upstream

git checkout -b myfeature upstream/master

and start making changes Always use a feature branch It's good practice to never work on the master branch

8 Develop the feature on your feature branch on your computer using Git to do the version control When you're done editing add changed files using git add and then git commit files

git add modified_files

git commit

to record your changes in Git then push the changes to your GitHub account with

git push -u origin myfeature

9 Follow these instructions to create a pull request from your fork This will send an email to the committers You may want to consider sending an email to the mailing list for more visibility

Note If you are modifying a Cython module you have to rerun step 5 after modifications and before testing them

It is often helpful to keep your local branch synchronized with the latest changes of the main scikitlearn repository

git fetch upstream

git merge upstream/master

Subsequently you might need to solve the conflicts You can refer to the Git documentation related to resolving merge conflict using the command line

Learning git

The Git documentation and <http://try.github.io> are excellent resources to get started with git and understanding all of the commands shown here

Pull request checklist

Before a PR can be merged it needs to be approved by two core developers Please prefix the title of your pull request with MRG if the contribution is complete and should be subjected to a detailed review An incomplete contribution

- where you expect to do more work before receiving a full review - should be prefixed WIP to indicate a work in progress and changed to MRG when it matures WIPs may be useful to indicate you are working on something to avoid duplicated work request broad review of functionality or API (Application Programming Interface) or seek collaborators WIPs often benefit from the inclusion of a task list in the PR description

2410 Chapter 7 Developer's Guide

scikitlearn user guide Release 0213

In order to ease the reviewing process we recommend that your contribution complies with the following rules before marking a PR as MRG. The bolded ones are especially important

1 Give your pull request a helpful title that summarises what your contribution does. This title will often become the commit message once merged so it should summarise your contribution for posterity. In some cases “Fix ISSUE TITLE” is enough. “Fix ISSUE NUMBER” is never a good title.

2 Make sure your code passes the tests. The whole test suite can be run with `pytest` but it is usually not recommended since it takes a long time. It is often enough to only run the test related to your changes for example if you changed something in `sklearn.linear_model.logistic.py` running the following commands will usually be enough

- `pytest sklearn.linear_model.logistic.py` to make sure the doctest examples are correct
- `pytest sklearn.linear_model.test.test_logistic.py` to run the tests specific to the file

- `pytest sklearn.linear_model` to test the whole Generalized Linear Models module
- `pytest sklearn.docstring_util` to make sure the user guide examples are correct
- `pytest sklearn.test.test_common.py` k LogisticRegression to run all our estimator checks specifically for LogisticRegression if that’s the estimator you changed

There may be other failing tests but they will be caught by the CI so you don’t need to run the whole test suite locally. You can read more in Testing and improving test coverage

3 Make sure your code is properly commented and documented and make sure the documentation renders properly. To build the documentation please refer to our Documentation guidelines. The CI will also build the docs please refer to Generated documentation on CircleCI

4 Tests are necessary for enhancements to be accepted. Bugfixes or new features should be provided with non regression tests. These tests verify the correct behavior of the fix or feature. In this manner further modifications on the code base are granted to be consistent with the desired behavior. In the case of bug fixes at the time of the PR the non regression tests should fail for the code base in the master branch and pass for the PR code

5 Make sure that your PR does not add PEP8 violations. On a Unixlike system you can run `make flake8diff` `flake8 path/to/file` would work for any system but please avoid reformatting parts of the file that your pull request doesn’t change as it distracts from code review

6 Follow the coding guidelines see below

7 When applicable use the validation tools and scripts in the `sklearn.utils` submodule. A list of utility routines available for developers can be found in the Utilities for Developers page

8 Often pull requests resolve one or more other issues or pull requests. If merging your pull request means that some other issues/PRs should be closed you should use keywords to create link to them eg `Fixes 1234` multiple issues/PRs are allowed as long as each one is preceded by a keyword. Upon merging those issues/PRs will automatically be closed by GitHub. If your pull request is simply related to some other issues/PRs create a link to them without using the keywords eg `See also 1234`

9 PRs should often substantiate the change through benchmarks of performance and efficiency or through examples of usage. Examples also illustrate the features and intricacies of the library to users. Have a look at other examples in the examples directory for reference. Examples should demonstrate why the new functionality is useful in practice and if possible compare it to other methods available in scikitlearn

10 New features often need to be illustrated with narrative documentation in the user guide with small code snippets. If relevant please also add references in the literature with PDF links when possible

11 The user guide should also include expected time and space complexity of the algorithm and scalability eg “this algorithm can scale to a large number of samples 100000 but does not scale in dimensionality n features is expected to be lower than 100”

71 Contributing 2411

scikitlearn user guide Release 0213

You can also check our Code Review Guidelines to get an idea of what reviewers will expect

You can check for common programming errors with the following tools

- Code with a good unittest coverage at least 80 better 100 check with
pip install pytest pytestcov
pytest cov sklearn pathtotestsforpackage

see also Testing and improving test coverage

Bonus points for contributions that include a performance analysis with a benchmark script and profiling output please report on the mailing list or on the GitHub issue

Also check out the How to optimize for speed guide for more details on profiling and Cython optimizations

Note The current state of the scikitlearn code base is not compliant with all of those guidelines but we expect that

enforcing those constraints on all new contributions will get the overall code base quality in the right direction

Note For two very well documented and more detailed guides on development workflow please pay a visit to the

Scipy Development Workflow and the Astropy Workflow for Developers sections

Continuous Integration CI

- Azure pipelines are used for testing scikitlearn on Linux Mac and Windows with different dependencies and settings

- CircleCI is used to build the docs for viewing for linting with flake8 and for testing with PyPy on Linux

Please note that if one of the following markers appear in the latest commit message the following actions are taken

Commit Message

MarkerAction Taken by CI

scipydev Add a Travis build with our dependencies numpy scipy etc develop
ment builds

ci skip CI is skipped completely

doc skip Docs are not built

doc quick Docs built but excludes example gallery plots

doc build Docs built including example gallery plots

Stalled pull requests

As contributing a feature can be a lengthy process some pull requests appear inactive but unfinished In such a case taking them over is a great service for the project

A good etiquette to take over is

- Determine if a PR is stalled

-A pull request may have the label “stalled” or “help wanted” if we have already identified it as a candidate for other contributors

2412 Chapter 7 Developer’s Guide

scikitlearn user guide Release 0213

-To decide whether an inactive PR is stalled ask the contributor if she/he plans to continue working on the PR in the near future Failure to respond within 2 weeks with an activity that moves the PR forward suggests that the PR is stalled and will result in tagging that PR with “help wanted”

Note that if a PR has received earlier comments on the contribution that have had no reply in a month it is safe to assume that the PR is stalled and to shorten the wait time to one day

After a sprint followup for unmerged PRs opened during sprint will be communicated to participants at the sprint and those PRs will be tagged “sprint” PRs tagged with “sprint” can be reassigned or declared stalled by sprint leaders

•Taking over a stalled PR To take over a PR it is important to comment on the stalled PR that you are taking over and to link from the new PR to the old one The new PR should be created by pulling from the old one

Issues for New Contributors

New contributors should look for the following tags when looking for issues We strongly recommend that new contributors tackle “easy” issues first this helps the contributor become familiar with the contribution workflow and for the core devs to become acquainted with the contributor besides which we frequently underestimate how easy an issue is to solve

good first issue tag

A great way to start contributing to scikitlearn is to pick an item from the list of good first issues in the issue tracker Resolving these issues allow you to start contributing to the project without much prior knowledge If you have already contributed to scikitlearn you should look at Easy issues instead

Easy tag

If you have already contributed to scikitlearn another great way to contribute to scikitlearn is to pick an item from the list of Easy issues in the issue tracker Your assistance in this area will be greatly appreciated by the more experienced developers as it helps free up their time to concentrate on other issues

help wanted tag

We often use the help wanted tag to mark issues regardless of difficulty Additionally we use the help wanted tag to mark Pull Requests which have been abandoned by their original contributor and are available for someone to pick up where the original contributor left off The list of issues with the help wanted tag can be found here

Note that not all issues which need contributors will have this tag

714 Documentation

We are glad to accept any sort of documentation function docstrings reStructuredText documents like this one tutorials etc reStructuredText documents live in the source code repository under the doc directory

You can edit the documentation using any text editor and then generate the HTML output by typing make from the doc directory Alternatively make html may be used to generate the documentation with the example gallery which takes quite some time The resulting HTML files will be placed in buildhtmlstable and are viewable in a web browser

71 Contributing 2413

scikitlearn user guide Release 0213

Building the documentation

First make sure you have properly installed the development version

Building the documentation requires installing some additional packages

pip install sphinx sphinxgallery numpydoc matplotlib Pillow pandas scikitimage

To build the documentation you need to be in the doc folder

cd doc

In the vast majority of cases you only need to generate the full web site without the example gallery

make

The documentation will be generated in the buildhtmlstable directory To also generate the example gallery

you can use

make html

This will run all the examples which takes a while If you only want to generate a few examples you can use

EXAMPLESPATTERNyourregexgoeshere make html

This is particularly useful if you are modifying a few examples

Set the environment variable NOMATHJAX1 if you intend to view the documentation in an offline setting

To build the PDF manual run

make latexpdf

Warning Sphinx version

While we do our best to have the documentation build under as many versions of Sphinx as possible the different

versions tend to behave slightly differently To get the best results you should use the same version as the one we

used on CircleCI Look at this github search to know the exact version

Guidelines for writing documentation

It is important to keep a good compromise between mathematical and algorithmic details and give intuition to the

reader on what the algorithm does

Basically to elaborate on the above it is best to always start with a small paragraph with a handwaving explanation of

what the method does to the data Then it is very helpful to point out why the feature is useful and when it should be

used the latter also including “big O” \mathcal{O} complexities of the algorithm as opposed to just rules of thumb as

the latter can be very machinedependent If those complexities are not available then rules of thumb may be provided

instead

Secondly a generated figure from an example as mentioned in the previous paragraph should then be included to

further provide some intuition

Next one or two small code examples to show its use can be added

2414 Chapter 7 Developer’s Guide

scikitlearn user guide Release 0213

Next any math and equations followed by references can be added to further the documentation Not starting the documentation with the maths makes it more friendly towards users that are just interested in what the feature will do as opposed to how it works “under the hood”

Finally follow the formatting rules below to make it consistently good

- Add “See also” in docstrings for related classesfunctions
- “See also” in docstrings should be one line per reference with a colon and an explanation for example
See also

SelectKBest Select features based on the k highest scores

SelectFpr Select features based on a false positive rate test

- For unwritten formatting rules try to follow existing good works
- For “References” in docstrings see the Silhouette Coefficient sklearnmetrics

silhouettescore

- When editing reStructuredText rst files try to keep line length under 80 characters when possible exceptions include links and tables

Generated documentation on CircleCI

When you change the documentation in a pull request CircleCI automatically builds it To view the documentation generated by CircleCI

- navigate to the bottom of your pull request page to see the CI statuses You may need to click on “Show all checks” to see all the CI statuses
- click on the CircleCI status with “doc” in the title
- addartifacts at the end of the URL Note you need to wait for the CircleCI build to finish before being able to look at the artifacts
- once the artifacts are visible navigate to docchangedhtml to see a list of documentation pages that are likely to be affected by your pull request Navigate to docindexhtml to see the full generated html documentation

If you often need to look at the documentation generated by CircleCI eg when reviewing pull requests you may find this tip very handy

715 Testing and improving test coverage

Highquality unit testing is a cornerstone of the scikitlearn development process For this purpose we use the pytest package The tests are functions appropriately named located in tests subdirectories that check the validity of the algorithms and the different options of the code

The full scikitlearn tests can be run using ‘make’ in the root folder Alternatively running ‘pytest’ in a folder will run all the tests of the corresponding subpackages

We expect code coverage of new features to be at least around 90

For guidelines on how to use pytest efficiently see the Useful pytest aliases and flags

71 Contributing 2415

scikitlearn user guide Release 0213

Writing matplotlib related tests

Test fixtures ensure that a set of tests will be executing with the appropriate initialization and cleanup The scikitlearn test suite implements a fixture which can be used with matplotlib
pyplot The pyplot fixture should be used when a test function is dealing with matplotlib matplotlib is a soft dependency and is not required This fixture is in charge of skipping the tests if matplotlib is not installed In addition figures created during the tests will be automatically closed once the test function has been executed

To use this fixture in a test function one needs to pass it as an argument

```
def test_requiring_mpl_fixture(pyplot):  
    you can now safely use matplotlib
```

Workflow to improve test coverage

To test code coverage you need to install the coverage package in addition to pytest

1 Run 'make testcoverage' The output lists for each file the line numbers that are not tested

2 Find a low hanging fruit looking at which lines are not tested write or adapt a test specifically for these

lines

3 Loop

Issue Tracker Tags

All issues and pull requests on the GitHub issue tracker should have at least one of the following tags

Bug Crash Something is happening that clearly shouldn't happen Wrong results as well as unexpected

errors from estimators go here

Cleanup Enhancement Improving performance usability consistency

Documentation Missing incorrect or substandard documentations and examples

New Feature Feature requests and pull requests implementing a new feature

There are four other tags to help new contributors

good first issue This issue is ideal for a first contribution to scikitlearn Ask for help if the formulation

is unclear If you have already contributed to scikitlearn look at Easy issues instead

Easy This issue can be tackled without much prior experience

Moderate Might need some knowledge of machine learning or the package but is still approachable for someone new to the project

help wanted This tag marks an issue which currently lacks a contributor or a PR that needs another contributor to take over the work These issues can range in difficulty and may not be approachable for new contributors Note that not all issues which need contributors will have this tag

716 Coding guidelines

The following are some guidelines on how new code should be written Of course there are special cases and there will be exceptions to these rules However following these rules when submitting new code makes the review easier so new code can be integrated in less time

scikitlearn user guide Release 0.21.3

Uniformly formatted code makes it easier to share code ownership The scikitlearn project tries to closely follow the official Python guidelines detailed in PEP8 that detail how code should be formatted and indented Please read it and follow it

In addition we add the following guidelines

- Use underscores to separate words in non class names `nsamples` rather than `nsamples`
- Avoid multiple statements on one line Prefer a line return after a control flow statement `ifor`
- Use relative imports for references inside scikitlearn
- Unit tests are an exception to the previous rule they should use absolute imports exactly as client code would

A corollary is that if `sklearnfoo` exports a class or function that is implemented in `sklearnfoobar` `baz` the test should import it from `sklearnfoo`

•Please don't use `importin` any case It is considered harmful by the official Python recommendations It makes the code harder to read as the origin of symbols is no longer explicitly referenced but most important it prevents using a static analysis tool like `pyflakes` to automatically find bugs in scikitlearn

- Use the `numpy` docstring standard in all your docstrings

A good example of code that we like can be found [here](#)

Input validation

The module `sklearnutils` contains various functions for doing input validation and conversion Sometimes `np.asarray` suffices for validation do not use `np.asarray` or `np.atleast2d` since those let NumPy's `np.matrix` through which has a different API (Application Programming Interface) eg means dot product on `np.matrix` but Hadamard product on `np.ndarray`

In other cases be sure to call `checkarray` on any arraylike argument passed to a scikitlearn API (Application Programming Interface) function The exact parameters to use depends mainly on whether and which `scipy` sparse matrices must be accepted

For more information refer to the [Utilities for Developers](#) page

Random Numbers

If your code depends on a random number generator do not use `numpy.random.random` or similar routines

To ensure repeatability in error checking the routine should accept a keyword `randomstate` and use this to construct a `numpy.random.RandomState` object See `sklearnutils.checkrandomstate` in [Utilities for Developers](#)

Here's a simple example of code using some of the above guidelines

```
from sklearnutils import checkarray checkrandomstate
defchoose_random_sample(X, randomstate=0)
```

Choose a random point from `X`

Parameters

`X` arraylike shape `(nsamples, nfeatures)`
array representing the data
`randomstate` `RandomState` or an int seed 0 by default
A random number generator instance to define the state of the random permutations generator

x numpy array shape nfeatures
A random point selected from X

X checkarrayX
randomstate checkrandomstaterandomstate
i randomstaterandintXshape0
returnXi

If you use randomness in an estimator instead of a freestanding function some additional guidelines apply
First off the estimator should take a randomstate argument to its init with a default value of
None It should store that argument's value unmodified in an attribute randomstate fit can call
checkrandomstate on that attribute to get an actual random number generator If for some reason ran
domness is needed after fit the RNG should be stored in an attribute randomstate The following example
should make this clear
class GaussianNoise BaseEstimator TransformerMixin
This estimator ignores its input and returns random Gaussian noise
It also does not adhere to all scikitlearn conventions
but showcases how to handle randomness

```
definitself ncomponents100 randomstate None
selfrandomstate randomstate
    the arguments are ignored anyway so we make them optional
deffitself X None yNone
selfrandomstate checkrandomstateselfrandomstate
deftransformself X
nsamples Xshape0
returnselfrandomstaterandnnsamples ncomponents
```

The reason for this setup is reproducibility when an estimator is fit twice to the same data it should produce an
identical model both times hence the validation in fit notinit
Deprecation

If any publicly accessible method function attribute or parameter is renamed we still support the old one for two
releases and issue a deprecation warning when it is calledpassedaccessed Eg if the function zeroone is re
named tozerooneloss we add the decorator deprecated fromsklearnutils tozeroone and call
zerooneloss from that function
from utils import deprecated
defzeroonelossytrue ypred normalize True
 actual implementation
pass
deprecated Function zeroone was renamed to zerooneloss
in version 013 and will be removed in release 015
Default behavior is changed from normalizeFalse to
normalizeTrue

scikitlearn user guide Release 0213

```
defzerooneytrue ypred normalize False
returnzeroonelossytrue ypred normalize
```

If an attribute is to be deprecated use the decorator deprecated on a property Please note that the property decorator should be placed before the deprecated decorator for the docstrings to be rendered properly Eg

renaming an attribute labels toclasses can be done as
deprecated Attribute labels was deprecated in version 013 and
will be removed in 015 Use classes instead

```
property
deflabelsself
returnselfclasses
```

If a parameter has to be deprecated use DeprecationWarning appropriately In the following example k is deprecated and renamed to nclusters

```
import warnings
defexamplefunctionnclusters8 knotused
ifk notused
```

warningswarnk was renamed to nclusters in version 013 and
will be removed in 015 DeprecationWarning
nclusters k

When the change is in a class we validate and raise warning in fit

```
import warnings
class ExampleEstimator BaseEstimator
definitself nclusters8 knotused
selfnclusters nclusters
```

```
selfk k
deffitself X y
ifselfk notused
warningswarnk was renamed to nclusters in version 013 and
will be removed in 015 DeprecationWarning
selfnclusters selfk
else
selfnclusters selfnclusters
```

As in these examples the warning message should always give both the version in which the deprecation happened and the version in which the old behavior will be removed If the deprecation happened in version 0xdev the message should say deprecation occurred in version 0x and the removal will be in 0x2 so that users will have enough time to adapt their code to the new behaviour For example if the deprecation happened in version 018dev the message should say it happened in version 018 and the old behavior will be removed in version 020

In addition a deprecation note should be added in the docstring recalling the same information as the deprecation warning as explained above Use the deprecated directive
deprecated 013

k was renamed to nclusters in version 013 and will be removed
in 015

What's more a deprecation requires a test which ensures that the warning is raised in relevant cases but not in other cases The warning should be caught in all other tests using eg pytestmarkfilterwarnings and there should be no warning in the examples

71 Contributing 2419

scikitlearn user guide Release 0213

Change the default value of a parameter

If the default value of a parameter needs to be changed please replace the default value with a specific value eg warn and raiseFutureWarning when users are using the default value In the following example we change the default value of nclusters from 5 to 10 current version is 020

```
import warnings
defexamplefunctionnclusterswarn
ifnclusters warn
warningswarnThe default value of nclusters will change from
5 to 10 in 022 FutureWarning
nclusters 5
```

When the change is in a class we validate and raise warning in fit

```
import warnings
class ExampleEstimator
definitself nclusterswarn
selfnclusters nclusters
deffitself X y
ifselfnclusters warn
warningswarnThe default value of nclusters will change from
5 to 10 in 022 FutureWarning
selfnclusters 5
```

Similar to deprecations the warning message should always give both the version in which the change happened and the version in which the old behavior will be removed The docstring needs to be updated accordingly We need a test which ensures that the warning is raised in relevant cases but not in other cases The warning should be caught in all other tests using eg pytestmarkfilterwarnings and there should be no warning in the examples

Python versions supported

Since scikitlearn 021 only Python 35 and newer is supported

717 Code Review Guidelines

Reviewing code contributed to the project as PRs is a crucial component of scikitlearn development We encourage anyone to start reviewing code of other developers The code review process is often highly educational for everybody involved This is particularly appropriate if it is a feature you would like to use and so can respond critically about whether the PR meets your needs While each pull request needs to be signed off by two core developers you can speed up this process by providing your feedback

Here are a few important aspects that need to be covered in any code review from highlevel questions to a more detailed checklist

- Do we want this in the library Is it likely to be used Do you as a scikitlearn user like the change and intend to use it Is it in the scope of scikitlearn Will the cost of maintaining a new feature be worth its benefits
- Is the code consistent with the API (Application Programming Interface) of scikitlearn Are public functionsclassesparameters well named and intuitively designed
- Are all public functionsclasses and their parameters return types and stored attributes named according to scikitlearn conventions and documented clearly

scikitlearn user guide Release 0213

- Is any new functionality described in the userguide and illustrated with examples
- Is every public functionclass tested Are a reasonable set of parameters their values value types and combinations tested Do the tests validate that the code is correct ie doing what the documentation says it does If the change is a bugfix is a nonregression test included Look at this to get started with testing in Python
- Do the tests pass in the continuous integration build If appropriate help the contributor understand why tests failed
- Do the tests cover every line of code see the coverage report in the build log If not are the lines missing coverage good exceptions
- Is the code easy to read and low on redundancy Should variable names be improved for clarity or consistency Should comments be added Should comments be removed as unhelpful or extraneous
- Could the code easily be rewritten to run much more efficiently for relevant settings
- Is the code backwards compatible with previous versions or is a deprecation cycle necessary
- Will the new code add any dependencies on other libraries this is unlikely to be accepted
- Does the documentation render properly see the Documentation section for more details and are the plots instructive

Standard replies for reviewing includes some frequent comments that reviewers may make

718 APIs of scikitlearn objects

To have a uniform API (Application Programming Interface) we try to have a common basic API (Application Programming Interface) for all the objects of framework code we try to adopt simple conventions and limit to a minimum the number of methods an object must implement

Elements of the scikitlearn API (Application Programming Interface) are described more definitively in the Glossary of Common Terms and API (Application Programming Interface)

Different objects

The main objects in scikitlearn are one class can implement multiple interfaces

Estimator The base object implements a fit method to learn from data either

estimator estimatorfitdata targets

or

estimator estimatorfitdata

Predictor For supervised learning or some unsupervised problems implements

prediction predictorpredictdata

Classification algorithms usually also offer a way to quantify certainty of a prediction either using

decisionfunction orpredictproba

probability predictorpredictprobadata

Transformer For filtering or modifying the data in a supervised or unsupervised way implements

newdata transformertransformdata

71 Contributing 2421

scikitlearn user guide Release 0213

When fitting and transforming can be performed much more efficiently together than separately implements

newdata transformerfittransformdata

Model A model that can give a goodness of fit measure or a likelihood of unseen data implements higher is better

score modelscoredata

Estimators

The API (Application Programming Interface) has one predominant object the estimator A estimator is an object that fits a model based on some training data and is capable of inferring some properties on new data It can be for instance a classifier or a regressor All

estimators implement the fit method

estimatorfitX y

All builtin estimators also have a setparams method which sets dataindependent parameters overriding previous parameter values passed to init

All estimators in the main scikitlearn codebase should inherit from sklearnbaseBaseEstimator

Instantiation

This concerns the creation of an object The object’s init method might accept constants as arguments that determine the estimator’s behavior like the C constant in SVMs It should not however take the actual training data as an argument as this is left to the fit method

clf2 SVCC23

clf3 SVC1 2 2 3 1 1 WRONG

The arguments accepted by init should all be keyword arguments with a default value In other words a user should be able to instantiate an estimator without passing any arguments to it The arguments should all correspond to hyperparameters describing the model or the optimisation problem the estimator tries to solve These initial arguments or parameters are always remembered by the estimator Also note that they should not be documented under the “Attributes” section but rather under the “Parameters” section for that estimator

In addition every keyword argument accepted by init should correspond to an attribute on the instance

Scikitlearn relies on this to find the relevant attributes to set on an estimator when doing model selection

To summarize an init should look like

definitself param11 param22

selfparam1 param1

selfparam2 param2

There should be no logic not even input validation and the parameters should not be changed The corresponding logic should be put where the parameters are used typically in fit The following is wrong

definitself param11 param22 param33

WRONG parameters should not be modified

ifparam1 1

param2 1

selfparam1 param1

2422 Chapter 7 Developer’s Guide

scikitlearn user guide Release 0213

WRONG the objects attributes should have exactly the name of the argument in the constructor

selfparam3 param2

The reason for postponing the validation is that the same validation would have to be performed in setparams which is used in algorithms like GridSearchCV

Fitting

The next thing you will probably want to do is to estimate some parameters in the model This is implemented in the fit method

Thefit method takes the training data as arguments which can be one array in the case of unsupervised learning or two arrays in the case of supervised learning

Note that the model is fitted using X and y but the object holds no reference to X and y There are however some exceptions to this as in the case of precomputed kernels where this data must be stored for use by the predict method

Parameters

X arraylike shape nsamples nfeatures

y array shape nsamples

kwargs optional datadependent parameters

Xshape0 should be the same as yshape0 If this requisite is not met an exception of type ValueError should be raised

ymight be ignored in the case of unsupervised learning However to make it possible to use the estimator as part of a pipeline that can mix both supervised and unsupervised transformers even unsupervised estimators need to accept

ayNone keyword argument in the second position that is just ignored by the estimator For the same reason

fitpredict fittransform score andpartialfit methods need to accept a yargument in the second place if they are implemented

The method should return the object self This pattern is useful to be able to implement quick one liners in an IPython session such as

ypredicted SVCC100fitXtrain ytrainpredictXtest

Depending on the nature of the algorithm fit can sometimes also accept additional keywords arguments However any parameter that can have a value assigned prior to having access to the data should be an init keyword

argument fit parameters should be restricted to directly data dependent variables For instance a Gram matrix or an affinity matrix which are precomputed from the data matrix Xare data dependent A tolerance stopping criterion

tol is not directly data dependent although the optimal value according to some scoring function probably is

Whenfit is called any previous call to fit should be ignored In general calling estimatorfitX1 and

thenestimatorfitX2 should be the same as only calling estimatorfitX2 However this may not

be true in practice when fit depends on some random process see randomstate Another exception to this rule is

when the hyperparameter warmstart is set toTrue for estimators that support it warmstartTrue means

that the previous state of the trainable parameters of the estimator are reused instead of using the default initialization strategy

Estimated Attributes

Attributes that have been estimated from the data must always have a name ending with trailing underscore for example the coefficients of some regression estimator would be stored in a coef attribute after fit has been called

71 Contributing 2423

scikitlearn user guide Release 0213

The estimated attributes are expected to be overridden when you call fit a second time

Optional Arguments

In iterative algorithms the number of iterations should be specified by an integer called niter

Pairwise Attributes

An estimator that accept X of shape samples n samples and defines a pairwise property equal to True allows for crossvalidation of the dataset eg when X is a precomputed kernel matrix Specifically the pairwise property is used by utilmetaestimatorssafesplit to slice rows and columns

719 Rolling your own estimator

If you want to implement a new estimator that is scikitlearn compatible whether it is just for you or for contributing it to scikitlearn there are several internals of scikitlearn that you should be aware of in addition to the scikitlearn API (Application Programming Interface) outlined above You can check whether your estimator adheres to the scikitlearn interface and standards by running

```
from sklearn.util.estimator_checks import check_estimator
from sklearn.svm import LinearSVC
check_estimator(LinearSVC)  # passes
```

The main motivation to make a class compatible to the scikitlearn estimator interface might be that you want to use it together with model evaluation and selection tools such as modelselectionGridSearchCV and pipelinePipeline

Before detailing the required interface below we describe two ways to achieve the correct interface more easily Project template

We provide a project template which helps in the creation of Python packages containing scikitlearn compatible estimators It provides

- an initial git repository with Python package directory structure
- a template of a scikitlearn estimator
- an initial test suite including use of check_estimator
- directory structures and scripts to compile documentation and example galleries
- scripts to manage continuous integration testing on Linux and Windows
- instructions from getting started to publishing on PyPi

BaseEstimator and mixins

We tend to use “duck typing” so building an estimator which follows the API (Application Programming Interface) suffices for compatibility without needing to inherit from or even import any scikitlearn classes

2424 Chapter 7 Developer’s Guide

scikitlearn user guide Release 0213

However if a dependency on scikitlearn is acceptable in your code you can prevent a lot of boilerplate code by deriving a class from BaseEstimator and optionally the mixin classes in sklearnbase For example below is a custom classifier with more examples included in the scikitlearncontrib project template

```
import numpy as np
from sklearnbase import BaseEstimator ClassifierMixin
from sklearnutilsvalidation import checkXy checkarray checkisfitted
from sklearnutilsmulticlass import uniquelabels
from sklearnmetrics import euclidean_distances
class TemplateClassifier BaseEstimator ClassifierMixin
```

```
def initself demoparamdemo
selfdemoparam demoparam
```

```
def fitself X y

    Check that X and y have correct shape
    X y checkXyX y
    Store the classes seen during fit
    selfclasses uniquelabelsy
```

```
selfX X
selfy y
    Return the classifier
return self
```

```
def predictself X

    Check is fit had been called
    checkisfittedself X y
```

```
    Input validation
    X checkarrayX
```

```
closest npargmineuclidean_distancesX selfX axis1
return selfyclosest
```

getparams and setparams

All scikitlearn estimators have getparams andsetparams functions The getparams function takes no arguments and returns a dict of the init parameters of the estimator together with their values It must take one keyword argument deep which receives a boolean value that determines whether the method should return the parameters of subestimators for most estimators this can be ignored The default value for deep should be true Thesetparams on the other hand takes as input a dict of the form parameter value and sets the parameter of the estimator using this dict Return value must be estimator itself

While thegetparams mechanism is not essential see Cloning below the setparams function is necessary as it is used to set parameters during grid searches

The easiest way to implement these functions and to get a sensible repr method is to inherit from sklearn baseBaseEstimator If you do not want to make your code dependent on scikitlearn the easiest way to implement the interface is

```
defgetparamsself deep True
```

```
    suppose this estimator has parameters alpha and recursive
returnalpha selfalpha recursive selfrecursive
```

```
scikitlearn user guide Release 0213
defsetparamself parameters
forparameter value inparametersitems
setattrself parameter value
returnself
```

Parameters and init

AsmodelselectionGridSearchCV usessetparams to apply parameter setting to estimators it is essential that calling setparams has the same effect as setting parameters using the init method The easiest and recommended way to accomplish this is to not do any parameter validation in init All logic behind estimator parameters like translating string arguments into functions should be done in fit Also it is expected that parameters with trailing arenot to be set inside the init method All and only the public attributes set by fit have a trailing As a result the existence of parameters with trailing is used to check if the estimator has been fitted

Cloning

For use with the modelselection module an estimator must support the baseclone function to replicate an estimator This can be done by providing a getparams method If getparams is present then cloneestimator will be an instance of typeestimator on whichsetparams has been called with clones of the result of estimatorgetparams Objects that do not provide this method will be deepcopied using the Python standard function copydeepcopy ifsafeFalse is passed to clone

Pipeline compatibility

For an estimator to be usable together with pipelinePipeline in any but the last step it needs to provide a fit orfittransform function To be able to evaluate the pipeline on any data but the training set it also needs to provide atransform function There are no special requirements for the last step in a pipeline except that it has a fit function All fit andfittransform functions must take arguments X y even if y is not used Similarly forscore to be usable the last step of the pipeline needs to have a score function that accepts an optional y

Estimator types

Some common functionality depends on the kind of estimator passed For example crossvalidation in modelselectionGridSearchCV andmodelselectioncrossvalscore defaults to being stratified when used on a classifier but not otherwise Similarly scorers for average precision that take a continuous prediction need to call decisionfunction for classifiers but predict for regressors This distinction between classifiers and regressors is implemented using the estimatortype attribute which takes a string value It should be classifier for classifiers and regressor for regressors and clusterer for clustering methods to work as expected Inheriting from ClassifierMixin RegressorMixin orClusterMixin will set the attribute automatically When a metaestimator needs to distinguish among estimator types instead of checking estimatortype directly helpers like baseisclassifier should be used

Specific models

Classifiers should accept ytarget arguments to fit that are sequences lists arrays of either strings or integers They should not assume that the class labels are a contiguous range of integers instead they should store a list of

scikitlearn user guide Release 0213

classes in a classes attribute or property The order of class labels in this attribute should match the order in which predictproba predictlogproba anddecisionfunction return their values The easiest way to achieve this is to put

```
self.classes_ = np.unique(y)
return inverse_transform(self.classes_, y)
```

infit This returns a new ythat contains class indexes rather than labels in the range 0 nclasses

A classifier’s predict method should return arrays containing class labels from classes In a classifier that implements decisionfunction this can be achieved with

```
def predict(self, X):
```

```
    D = self.decision_function(X)
```

```
    return self.classes_[np.argmax(D, axis=1)]
```

In linear models coefficients are stored in an array called coef and the independent term is stored in intercept

sklearnlinearmodelbase contains a few base classes and mixins that implement common linear model

patterns

The sklearnutilsmulticlass module contains useful functions for working with multiclass and multilabel

problems

Estimator Tags

Warning The estimator tags are experimental and the API (Application Programming Interface) is subject to change

Scikitlearn introduced estimator tags in version 021 These are annotations of estimators that allow programmatic

inspection of their capabilities such as sparse matrix support supported output types and supported methods The

estimator tags are a dictionary returned by the method gettags These tags are used by the common tests and

thesklearnutilsestimatorcheckscheckestimator function to decide what tests to run and what

input data is appropriate Tags can depend on estimator parameters or even system architecture and can in general only

be determined at runtime

The default value of all tags except for Xtypes isFalse These are defined in the BaseEstimator class

The current set of estimator tags are

nondeterministic whether the estimator is not deterministic given a fixed randomstate

requirespositivedata unused for now whether the estimator requires positive X

novalidation whether the estimator skips inputvalidation This is only meant for stateless and dummy transformers

multioutput unused for now whether a regressor supports multitarget outputs or a classifier supports multiclass

multioutput

multilabel whether the estimator supports multilabel output

stateless whether the estimator needs access to data for fitting Even though an estimator is stateless it might still

need a call to fit for initialization

allownan whether the estimator supports data with missing values encoded as npNaN

poorscore whether the estimator fails to provide a “reasonable” testset score which currently for regression

is an R2 of 05 on a subset of the boston housing dataset and for classification an accuracy of 083 on

makeblobsnsamples300 randomstate0 These datasets and values are based on current

estimators in sklearn and might be replaced by something more systematic

multioutputonly whether estimator supports only multioutput classification or regression

71 Contributing 2427

scikitlearn user guide Release 0213

skiptest whether to skip common tests entirely Don't use this unless you have a very good reason
Xtypes Supported input types for X as list of strings Tests are currently only run if '2darray' is contained in the list
signifying that the estimator takes continuous 2d numpy arrays as input The default value is '2darray' Other
possible types are string sparse categorical dict 1dlabels and 2dlabels
The goal is that in the future the supported input type will determine the data used during testing in particular
forstring sparse andcategorical data For now the test for sparse data do not make use of
thesparse tag

To override the tags of a child class one must define the moretags method and return a dict with the desired
tags eg
class MyMultiOutputEstimator BaseEstimator
defmoretagsself
returnmultioutputonly True
nondeterministic True

In addition to the tags estimators also need to declare any nonoptional parameters to init in the
requiredparameters class attribute which is a list or tuple If requiredparameters is only
estimator orbaseestimator then the estimator will be instantiated with an instance of
LinearDiscriminantAnalysis orRidgeRegression if the estimator is a regressor in the tests The
choice of these two models is somewhat idiosyncratic but both should provide robust closedform solutions

7110 Reading the existing code base

Reading and digesting an existing code base is always a difficult exercise that takes time and experience to master
Even though we try to write simple code in general understanding the code can seem overwhelming at first given the
sheer size of the project Here is a list of tips that may help make this task easier and faster in no particular order

- Get acquainted with the APIs of scikitlearn objects understand what fitpredict transform etc are used for
- Before diving into reading the code of a function class go through the docstrings first and try to get an idea of
what each parameter attribute is doing It may also help to stop a minute and think how would I do this myself
if I had to

- The trickiest thing is often to identify which portions of the code are relevant and which are not In scikit
learn a lot of input checking is performed especially at the beginning of the fitmethods Sometimes
only a very small portion of the code is doing the actual job For example looking at the fit method
ofsklearnlinearmodelLinearRegression what you're looking for might just be the call the
scipylininalglsq but it is buried into multiple lines of input checking and the handling of different
kinds of parameters

- Due to the use of Inheritance some methods may be implemented in parent classes All estimators inherit
at least from BaseEstimator and from a Mixin class eg ClassifierMixin that enables default
behaviour depending on the nature of the estimator classifier regressor transformer etc
- Sometimes reading the tests for a given function will give you an idea of what its intended purpose is You can
usegit grep see below to find all the tests written for a function Most tests for a specific functionclass
are placed under the tests folder of the module
- You'll often see code looking like this out Parallel
delayedsomefunctionparam for param in someiterable This runs
somefunction in parallel using Joblib out is then an iterable containing the values returned by
somefunction for each call

- We use Cython to write fast code Cython code is located in pyx andpxd files Cython code has a more
Clike flavor we use pointers perform manual memory allocation etc Having some minimal experience in C

2428 Chapter 7 Developer's Guide

scikitlearn user guide Release 0213

C is pretty much mandatory here

- Master your tools

-With such a big project being efficient with your favorite editor or IDE goes a long way towards digesting the code base Being able to quickly jump or peek to a functionclassattribute definition helps a lot So does being able to quickly see where a given name is used in a file

-git also has some builtin killer features It is often useful to understand how a file changed over time using eggit blame manual This can also be done directly on GitHub git grep examples is also extremely useful to see every occurrence of a pattern eg a function call or a variable in the code base

72 Developers' Tips and Tricks

721 Productivity and sanitypreserving tips

In this section we gather some useful advice and tools that may increase your qualityoflife when reviewing pull requests running unit tests and so forth Some of these tricks consist of userscripts that require a browser extension such as TamperMonkey or GreaseMonkey to set up userscripts you must have one of these extensions installed enabled and running We provide userscripts as GitHub gists to install them click on the "Raw" button on the gist page

Viewing the rendered HTML documentation for a pull request

We use CircleCI to build the HTML documentation for every pull request To access that documentation instructions are provided in the documentation section of the contributor guide To save you a few clicks we provide a userscript that adds a button to every PR After installing the userscript navigate to any GitHub PR a new button labeled "See CircleCI doc for this PR" should appear in the topright area

Folding and unfolding outdated diffs on pull requests

GitHub hides discussions on PRs when the corresponding lines of code have been changed in the mean while This userscript provides a shortcut ControlAltP at the time of writing but look at the code to be sure to unfold all such hidden discussions at once so you can catch up

Checking out pull requests as remotetracking branches

In your local fork add to your gitconfig under theremote upstream heading the line

fetch refspull headrefsremotesupstreampr

You may then use git checkout prPRNUMBER to navigate to the code of the pullrequest with the given number Read more in this gist

Display code coverage in pull requests

To overlay the code coverage reports generated by the CodeCov continuous integration consider this browser extension The coverage of each line will be displayed as a color background behind the line number

72 Developers' Tips and Tricks 2429

scikitlearn user guide Release 0213

Useful pytest aliases and flags

The full test suite takes fairly long to run For faster iterations it is possibly to select a subset of tests using pytest selectors In particular one can run a single test based on its node ID

pytest v sklearnlinearmodelteststestlogisticpytestsparsify
or use the k pytest parameter to select tests based on their name For instance

pytest sklearnnteststestcommonpy v k LogisticRegression
will run all common tests for theLogisticRegression estimator

When a unit test fails the following tricks can make debugging easier

1 The command line argument pytest l instructs pytest to print the local variables when a failure occurs
2 The argument pytest pdb drops into the Python debugger on failure To instead drop into the rich IPython

debuggeripdb you may set up a shell alias to
pytest pdbcslIPythonterminaldebuggerTerminalPdb capture no

Otherpytest options that may become useful include

- xwhich exits on the first failed test
- lf to rerun the tests that failed on the previous run
- ff to rerun all previous tests running the ones that failed first
- sso that pytest does not capture the output of print statements
- tbshort ortbline to control the length of the logs

Since our continuous integration tests will error if DeprecationWarning orFutureWarning aren't prop
erly caught it is also recommended to run pytest along with the WerrorDeprecationWarning and

WerrorFutureWarning flags

Standard replies for reviewing

Issue Selfcontained example for bug

Please provide selfcontained example codehttpsstackoverflowcomhelpmcve

↪including imports and data if possible so that other contributors can just

↪run it and reproduce your issue Ideally your example code should be minimal

2430 Chapter 7 Developer's Guide

scikitlearn user guide Release 0213
Issue Software versions
To help diagnose your issue please paste the output of
py
import sklearn sklearnshowversions

Thanks
Issue Code blocks
Readability can be greatly improved if you format <https://help.github.com/articles/creating-and-highlighting-code-blocks> your code snippets and
complete error messages appropriately For example
python
print(something)

generates
python
print(something)

And
pytb
Traceback most recent call last
File stdin line 1 in module
ImportError No module named hello

generates
pytb
Traceback most recent call last
File stdin line 1 in module
ImportError No module named hello

You can edit your issue descriptions and comments at any time to improve
readability This helps maintainers a lot Thanks
IssueComment Linking to code
Friendly advice for claritys sake you can link to code like this <https://help.github.com/articles/creating-a-permanent-link-to-a-code-snippet>
IssueComment Linking to comments
Please use links to comments which make it a lot easier to see what you are
referring to rather than just linking to the issue See this <https://stackoverflow.com/questions/25163598/how-to-reference-a-specific-issue>
comment on github for more details
PRNEW Better description
Thanks for the pull request Please make the title of the PR descriptive so that
we can easily recall the issue it is resolving You should state what issue or
PR it fixes/resolves in the description see here <https://scikitlearn.org/dev/developers-contributing.html#contributing-pull-requests>
PRNEW Fix
72 Developers' Tips and Tricks 2431

scikitlearn user guide Release 0213

Please use `Fix issueNumber` in your PR description and you can do it more than once This way the associated issue gets closed automatically when the PR is merged For more details look at [this https://github.com/blog/1506-closing-issues-via-pull-requests](https://github.com/blog/1506-closing-issues-via-pull-requests)

PRNEW or Issue Maintenance cost

Every feature we include has a maintenance cost <https://scikitlearn.org/devfaq.html#why-are-you-so-selective-on-what-algorithms-you-include-in-scikitlearn>

Our maintainers are mostly volunteers For a new feature to be included we need evidence that it is often useful and ideally well established <https://scikitlearn.org/devfaq.html#what-are-the-inclusion-criteria-for-new-algorithms-in-the-literature-or-in-practice> That doesn't stop you implementing it for yourself and publishing it in a separate repository or even [scikitlearn-contrib https://scikitlearn-contrib.github.io](https://scikitlearn-contrib.github.io)

PRWIP What's needed before merge

Please clarify perhaps as a TODO list in the PR description what work you believe still needs to be done before it can be reviewed for merge When it is ready please prefix the PR title with MRG

PRWIP Regression test needed

Please add a nonregression test https://en.wikipedia.org/wiki/Nonregression_testing that would fail at master but pass in this PR

PRWIP PEP8

You have some PEP8 <https://www.python.org/dev/peps/pep-0008> violations whose details you can see in the Circle CI lint job It might be worth configuring your code editor to check for such errors on the fly so you can catch them before committing

PRMRG Patience

Before merging we generally require two core developers to agree that your pull request is desirable and ready Please be patient <https://scikitlearn.org/devfaq.html#why-is-my-pull-request-not-getting-any-attention> as we mostly rely on volunteered time from busy core developers You are also welcome to help us out with reviewing other PRs <https://scikitlearn.org/dev/developers-contributing.html#code-review-guidelines>

PRMRG Add to what's new

Please add an entry to the change log at `doc/whatsnew/vrst` Like the other entries there please reference this pull request with `pr` and credit yourself and other contributors if applicable with `user`

PR Don't change unrelated

Please do not change unrelated lines It makes your contribution harder to review and may introduce merge conflicts to other pull requests

2432 Chapter 7 Developer's Guide

scikitlearn user guide Release 0213

722 Debugging memory errors in Cython with valgrind

While pythonnumpy's builtin memory management is relatively robust it can lead to performance penalties for some routines For this reason much of the highperformance code in scikitlearn is written in cython This performance gain comes with a tradeoff however it is very easy for memory bugs to crop up in cython code especially in situations where that code relies heavily on pointer arithmetic

Memory errors can manifest themselves a number of ways The easiest ones to debug are often segmentation faults and related glibc errors Uninitialized variables can lead to unexpected behavior that is difficult to track down A very useful tool when debugging these sorts of errors is valgrind

Valgrind is a commandline tool that can trace memory errors in a variety of code Follow these steps

1 Install valgrind on your system

2 Download the python valgrind suppression file valgrindpythonsupp

3 Follow the directions in the READMEvalgrind file to customize your python suppressions If you don't you will have spurious output coming related to the python interpreter instead of your own code

4 Run valgrind as follows

valgrind v suppressionsvalgrindpythonsupp python mytestscriptpy

The result will be a list of all the memoryrelated errors which reference lines in the Ccode generated by cython from your pyx file If you examine the referenced lines in the c file you will see comments which indicate the corresponding location in your pyx source file Hopefully the output will give you clues as to the source of your memory error

For more information on valgrind and the array of options it has see the tutorials and documentation on the valgrind web site

73 Utilities for Developers

Scikitlearn contains a number of utilities to help with development These are located in sklearnutils and include tools in a number of categories All the following functions and classes are in the module sklearnutils Warning These utilities are meant to be used internally within the scikitlearn package They are not guaranteed to be stable between versions of scikitlearn Backports in particular will be removed as the scikitlearn dependencies evolve

731 Validation Tools

These are tools used to check and validate input When you write a function which accepts arrays matrices or sparse matrices as arguments the following should be used when applicable

- assertallfinite Throw an error if array contains NaNs or Infs
- asfloatarray convert input to an array of floats If a sparse matrix is passed a sparse matrix will be returned
- checkarray check that input is a 2D array raise error on sparse matrices Allowed sparse matrix formats can be given optionally as well as allowing 1D or Ndimensional arrays Calls assertallfinite by default

73 Utilities for Developers 2433

scikitlearn user guide Release 0213

- checkXy check that X and y have consistent length calls checkarray on X and columnor1d on y For multilabel classification or multitarget regression specify multioutputTrue in which case checkarray will be called on y
- indexable check that all input arrays have consistent length and can be sliced or indexed using safeindex This is used to validate input for crossvalidation
- validationcheckmemory checks that input is joblibMemory like which means that it can be converted into a sklearnutilsMemory instance typically a str denoting the cachedir or has the same interface

If your code relies on a random number generator it should never use functions like numpyrandomrandom ornumpyrandomnormal This approach can lead to repeatability issues in unit tests Instead a numpy randomRandomState object should be used which is built from a randomstate argument passed to the class or function The function checkrandomstate below can then be used to create a random number generator object

- checkrandomstate create anrandomRandomState object from a parameter randomstate
- Ifrandomstate isNone ornp.random then a randomlyinitialized RandomState object is re turned
- Ifrandomstate is an integer then it is used to seed a new RandomState object
- Ifrandomstate is aRandomState object then it is passed through

For example

```
from sklearnutils import checkrandomstate
randomstate 0
randomstate checkrandomstaterandomstate
randomstaterand4
array05488135 071518937 060276338 054488318
```

When developing your own scikitlearn compatible estimator the following helpers are available

- validationcheckisfitted check that the estimator has been fitted before calling transform predict or similar methods This helper allows to raise a standardized error message across estimator
- validationhasfitparameter check that a given parameter is supported in the fit method of a given estimator

732 Efficient Linear Algebra Array Operations

- extmathrandomizedrangefinder construct an orthonormal matrix whose range approximates the range of the input This is used in extmathrandomizedsvd below
- extmathrandomizedsvd compute the ktruncated randomized SVD This algorithm finds the exact truncated singular values decomposition using randomization to speed up the computations It is particularly fast on large matrices on which you wish to extract only a small number of components
- arrayfuncscholeskydelete used insklearnlinearmodelarspath Remove an item from a cholesky factorization
- arrayfunscminpos used insklearnlinearmodelleangle Find the minimum of the positive values within an array
- extmathfastlogdet efficiently compute the log of the determinant of a matrix
- extmathdensity efficiently compute the density of a sparse vector

scikitlearn user guide Release 0213

- extmathsafeparsedot dot product which will correctly handle scipysparse inputs If the inputs are dense it is equivalent to numpydot
- extmathweightedmode an extension of scipystatsmode which allows each item to have a real valued weight

- resample Resample arrays or sparse matrices in a consistent way used in shuffle below
- shuffle Shuffle arrays or sparse matrices in a consistent way Used in sklearnclusterkmeans

733 Efficient Random Sampling

- randomsamplewithoutreplacement implements efficient algorithms for sampling nsamples

integers from a population of size npopulation without replacement

734 Efficient Routines for Sparse Matrices

The sklearnutilssparsefuncs cython module hosts compiled extensions to efficiently process scipy

sparse data

- sparsefuncsmeanvarianceaxis compute the means and variances along a specified axis of a CSR (Compressed Sparse Row)

matrix Used for normalizing the tolerance stopping criterion in sklearnclusterKMeans

- sparsefuncsfastinplacecsrrownormalizel1 andsparsefuncsfast

inplacecsrrownormalizel2 can be used to normalize individual sparse samples to unit L1

or L2 norm as done in sklearnpreprocessingNormalizer

- sparsefuncsinplacecsrcolumnscale can be used to multiply the columns of a CSR (Compressed Sparse Row) matrix

by a constant scale one scale per column Used for scaling features to unit standard deviation in sklearn

preprocessingStandardScaler

735 Graph Routines

- graphssinglesourceshortestpathlength not currently used in scikitlearn Return the

shortest path from a single source to all connected nodes on a graph Code is adapted from networkx

If this is ever needed again it would be far faster to use a single iteration of Dijkstra’s algorithm from

graphshortestpath

- graphshortestpathgraphshortestpath used insklearnmanifoldIsomap Return

the shortest path between all pairs of connected points on a directed or undirected graph Both the Floyd

Warshall algorithm and Dijkstra’s algorithm are available The algorithm is most efficient when the connectivity

matrix is ascipysparsecsrmatrix

736 Testing Functions

- testingassertin testingassertnotin Assertions for container membership Designed for

forward compatibility with Nose 10

- testingassertraisemessage Assertions for checking the error raise message

- testingmockmldataurlopen Mocks the urlopen function to fake requests to mldataorg Used in

tests ofsklearn datasets

- testingalallestimators returns a list of all estimators in scikitlearn to test for consistent behavior

and interfaces

73 Utilities for Developers 2435

scikitlearn user guide Release 0213

737 Multiclass and multilabel utility function

- multiclassismultilabel Helper function to check if the task is a multilabel classification one
- multiclassuniquelabels Helper function to extract an ordered array of unique labels from different formats of target

738 Helper Functions

- genevenslices generator to create npacks of slices going up to n Used in sklearn decompositiondictlearning andsklearnclusterkmeans
- safemask Helper function to convert a mask to the format expected by the numpy array or scipy sparse matrix on which to use it sparse matrices support integer indices only while numpy arrays support both boolean masks and integer indices
- safesqr Helper function for unified squaring 2 of arraylikes matrices and sparse matrices

739 Hash Functions

- murmurhash332 provides a python wrapper for the MurmurHash3x8632 C non cryptographic hash function This hash function is suitable for implementing lookup tables Bloom filters Count Min Sketch feature hashing and implicitly defined sparse random projections
- ```
from sklearnutils import murmurhash332
murmurhash332some feature seed0 384616559
True
murmurhash332some feature seed0 positive True 3910350737
True
```

The sklearnutilsmurmurhash module can also be “cimported” from other cython modules so as to benefit from the high performance of MurmurHash while skipping the overhead of the Python interpreter

7310 Warnings and Exceptions

- deprecated Decorator to mark a function or class as deprecated
- sklearnexceptionsConvergenceWarning Custom warning to catch convergence problems Used

insklearncovariancegraphicallasso

74 How to optimize for speed

The following gives some practical guidelines to help you write efficient code for the scikitlearn project

Note While it is always useful to profile your code so as to check performance assumptions it is also highly recommended to review the literature to ensure that the implemented algorithm is the state of the art for the task before investing into costly implementation optimization

Times and times hours of efforts invested in optimizing complicated implementation details have been rendered irrelevant by the subsequent discovery of simple algorithmic tricks or by using another algorithm altogether that is better suited to the problem

2436 Chapter 7 Developer’s Guide

scikitlearn user guide Release 0213

The section A simple algorithmic trick warm restarts gives an example of such a trick

741 Python Cython or CC

In general the scikitlearn project emphasizes the readability of the source code to make it easy for the project users to dive into the source code so as to understand how the algorithm behaves on their data but also for ease of maintainability by the developers

When implementing a new algorithm is thus recommended to start implementing it in Python using Numpy and Scipy by taking care of avoiding looping code using the vectorized idioms of those libraries In practice this means trying to replace any nested for loops by calls to equivalent Numpy array methods The goal is to avoid the CPU wasting time in the Python interpreter rather than crunching numbers to fit your statistical model It's generally a good idea to consider NumPy and SciPy performance tips <http://scipy.github.io/oldwiki/pages/PerformanceTips>

Sometimes however an algorithm cannot be expressed efficiently in simple vectorized Numpy code In this case the recommended strategy is the following

1 Profile the Python implementation to find the main bottleneck and isolate it in a dedicated module level function This function will be reimplemented as a compiled extension module

2 If there exists a well maintained BSD (Binary Search Decision) or MIT CC implementation of the same algorithm that is not too big you can write a Cython wrapper for it and include a copy of the source code of the library in the scikit learn source tree this strategy is used for the classes svmLinearSVC svmSVC and linearModel

LogisticRegression wrappers for liblinear and libsvm

3 Otherwise write an optimized version of your Python function using Cython directly This strategy is used for the linearModel ElasticNet and linearModelSGDClassifier classes for instance

4 Move the Python version of the function in the tests and use it to check that the results of the compiled extension are consistent with the gold standard easy to debug Python version

5 Once the code is optimized not simple bottleneck spottable by profiling check whether it is possible to have coarse grained parallelism that is amenable to multiprocessing by using the joblibParallel class

When using Cython use either

python setup.py build\_ext in python setup.py install

to generate C files You are responsible for adding ccpp extensions along with build parameters in each submodule setup.py

CC generated files are embedded in distributed stable packages The goal is to make it possible to install scikitlearn stable version on any machine with Python Numpy Scipy and CC compiler

742 Profiling Python code

In order to profile Python code we recommend to write a script that loads and prepare you data and then use the IPython integrated profiler for interactively exploring the relevant part for the code

Suppose we want to profile the Non Negative Matrix Factorization module of scikitlearn Let us setup a new IPython session and load the digits dataset and as in the Recognizing handwritten digits example

In 1 from sklearn.decomposition import NMF (Non-Negative Matrix Factorization)

In 2 from sklearn.datasets import load\_digits

In 3 X = load\_digits.data

74 How to optimize for speed 2437

scikitlearn user guide Release 0213

Before starting the profiling session and engaging in tentative optimization iterations it is important to measure the total execution time of the function we want to optimize without any kind of profiler overhead and save it somewhere for later reference

In 4 timeit NMFncomponents16 tol1e2fitX  
1 loops best of 3 17 s per loop

To have a look at the overall performance profile using the prun magic command

In 5 prun l nmfpy NMFncomponents16 tol1e2fitX  
14496 function calls in1682 CPU seconds  
Ordered by internal time  
List reduced from90 to 9 due to restriction nmfpy  
ncalls tottime percall cumtime percall filename:lineno:funcname  
36 0609 0017 1499 0042 nmfpy151nlssubproblem  
1263 0157 0000 0157 0000 nmfpy18pos  
1 0053 0053 1681 1681 nmfpy352fittransform  
673 0008 0000 0057 0000 nmfpy28norm  
1 0006 0006 0047 0047 nmfpy42initializenmf  
36 0001 0000 0010 0000 nmfpy36sparseness  
30 0001 0000 0001 0000 nmfpy23neg  
1 0000 0000 0000 0000 nmfpy337init  
1 0000 0000 1681 1681 nmfpy461fit

The tottime column is the most interesting it gives to total time spent executing the code of a given function ignoring the time spent in executing the subfunctions The real total time local code subfunction calls is given by the cumtime column

Note the use of the l nmfpy that restricts the output to lines that contains the “nmfpy” string This is useful to have a quick look at the hotspot of the nmf Python module itself ignoring anything else

Here is the beginning of the output of the same command without the l nmfpy filter

In 5 prun NMFncomponents16 tol1e2fitX  
16159 function calls in1840 CPU seconds  
Ordered by internal time  
ncalls tottime percall cumtime percall filename:lineno:funcname  
2833 0653 0000 0653 0000 numpycoredotblasdot  
46 0651 0014 1636 0036 nmfpy151nlssubproblem  
1397 0171 0000 0171 0000 nmfpy18pos  
2780 0167 0000 0167 0000 method sum of numpyndarray  
→objects  
1 0064 0064 1840 1840 nmfpy352fittransform  
1542 0043 0000 0043 0000 method flatten of numpyndarray  
→objects  
337 0019 0000 0019 0000 method all of numpyndarray  
→objects  
2734 0011 0000 0181 0000 fromnumericpy1185sum  
2 0010 0005 0010 0005 numpylinalgpackklitedgesdd  
748 0009 0000 0065 0000 nmfpy28norm

The above results show that the execution is largely dominated by dot products operations delegated to blas Hence there is probably no huge gain to expect by rewriting this code in Cython or CC in this case out of the 17s total execution time almost 07s are spent in compiled code we can consider optimal By rewriting the rest of the Python

2438 Chapter 7 Developer’s Guide

scikitlearn user guide Release 0213

code and assuming we could achieve a 1000 boost on this portion which is highly unlikely given the shallowness of the Python loops we would not gain more than a 24x speedup globally  
Hence major improvements can only be achieved by algorithmic improvements in this particular example eg trying to find operation that are both costly and useless to avoid computing then rather than trying to optimize their implementation

It is however still interesting to check what's happening inside the nlssubproblem function which is the hotspot if we only consider Python code it takes around 100 of the accumulated time of the module In order to better understand the profile of this specific function let us install lineprofiler and wire it to IPython

pip install lineprofiler

•Under IPython 013 first create a configuration profile

ipython profile create

Then register the lineprofiler extension in ipythonprofiledefaultipythonconfigpy

cTerminalIPythonAppextensionsappendlineprofiler

cInteractiveShellAppextensionsappendlineprofiler

This will register the lprun magic command in the IPython terminal application and the other frontends such as qtconsole and notebook

Now restart IPython and let us use this new toy

In 1 from sklearn.datasets import load\_digits

In 2 from sklearn.decomposition.nmf import nlssubproblem NMF (Non-Negative Matrix Factorization)

In 3 X = load\_digits.data

In 4 lprun -f nlssubproblem NMF ncomponents=16 tol=1e-2 fit X

Timer unit 1e06 s

File sklearn.decomposition.nmf.py

Function nlssubproblem at line 137

Total time 173153 s

Line Hits Time Per Hit Time Line Contents

137 def nlssubproblem(V, W, Hinit

```

By looking at the top values of the Time column it is really easy to pinpoint the most expensive expressions that would deserve additional care

743 Memory usage profiling

You can analyze in detail the memory usage of any Python code with the help of memoryprofiler First install the latest version

```
pip install U memoryprofiler
```

Then setup the magics in a manner similar to lineprofiler

- Under IPython 011 first create a configuration profile

```
ipython profile create
```

Then register the extension in ipythonprofiledefaultipythonconfigpy alongside the line profiler

```
cTerminalIPythonAppextensionsappendmemoryprofiler
```

```
cInteractiveShellAppextensionsappendmemoryprofiler
```

This will register the memit andmprun magic commands in the IPython terminal application and the other frontends such as qtconsole and notebook

mprun is useful to examine linebyline the memory usage of key functions in your program It is very similar to lprun discussed in the previous section For example from the memoryprofilerexamples directory

```
In 1from example import myfunc
```

```
In 2 mprun f myfunc myfunc
```

Filename examplepy

Line Mem usage Increment Line Contents

```
3 profile
```

```
4 597 MB 000 MB defmyfunc
```

scikitlearn user guide Release 0213

5 1361 MB 764 MB a 1 106

6 16620 MB 15259 MB b 2 2107

7 1361 MB 15259 MB delb

8 1361 MB 000 MB returna

Another useful magic that memoryprofiler defines is memit which is analogous to timeit It can be used as follows

In 1 import numpy as np

In 2 memit npzeros1e7

maximum of 3 76402344 MB per loop

For more details see the docstrings of the magics using memit andmprun

744 Performance tips for the Cython developer

If profiling of the Python code reveals that the Python interpreter overhead is larger by one order of magnitude or more than the cost of the actual numerical computation eg for loops over vector components nested evaluation of conditional expression scalar arithmetic it is probably adequate to extract the hotspot portion of the code as a standalone function in a pyx file add static type declarations and then use Cython to generate a C program suitable to be compiled as a Python extension module

The official documentation available at <http://docscython.org> contains a tutorial and reference guide for developing such a module In the following we will just highlight a couple of tricks that we found important in practice on the existing cython codebase in the scikitlearn project

TODO html report type declarations bound checks division by zero checks memory alignment direct blas calls

- <https://www.youtube.com/watch?v=MvkiQgOW8>
- <http://conferencescipy.org/proceedings/SciPy2009/paper1>
- <http://conferencescipy.org/proceedings/SciPy2009/paper2>

Using OpenMP

Since scikitlearn can be built without OpenMP support it's necessary to protect each direct call to OpenMP This can be done using the following syntax

importing OpenMP

IF SKLEARNOPENMPSUPPORTED

cimport openmp

calling OpenMP

IF SKLEARNOPENMPSUPPORTED

maxthreads openmpompgetmaxthreads

ELSE

maxthreads 1

Note Protecting the parallel loop prange is already done by cython

74 How to optimize for speed 2441

scikitlearn user guide Release 0213

745 Profiling compiled extensions

When working with compiled extensions written in CC with a wrapper or directly as Cython extension the default Python profiler is useless we need a dedicated tool to introspect what’s happening inside the compiled extension it self

Using yep and gperftools

Easy profiling without special compilation options use yep

- <https://pypi.org/project/yep/>
- <http://fabianp.net/blog/2011/a-profiler-for-python-extensions>

Using gprof

In order to profile compiled Python extensions one could use gprof after having recompiled the project with gcc pg and using the pythondbg variant of the interpreter on debian ubuntu however this approach requires to also have numpy and scipy recompiled with pg which is rather complicated to get working

Fortunately there exist two alternative profilers that don’t require you to recompile everything

Using valgrind callgrind kcache-grind

kcache-grind

yep can be used to create a profiling report kcache-grind provides a graphical environment to visualize this report

Run yep to profile some python script

python m yep c myfile.py

open myfile.py callgrind with kcache-grind

kcache-grind myfile.py prof

Note yep can be executed with the argument lines or to compile a profiling report ‘line by line’

746 Multicore parallelism using joblib.Parallel

TODO give a simple teaser example here

Checkout the official joblib documentation

- <https://joblib.readthedocs.io>

747 A simple algorithmic trick warm restarts

See the glossary entry for warmstart

2442 Chapter 7 Developer’s Guide

scikitlearn user guide Release 0213

75 Advanced installation instructions

There are different ways to get scikitlearn installed

- Install an official release This is the best approach for most users It will provide a stable version and prebuild packages are available for most platforms
  - Install the version of scikitlearn provided by your operating system or Python distribution This is a quick option for those who have operating systems that distribute scikitlearn It might not provide the latest release version
  - Building the package from source This is best for users who want the latestandgreatest features and aren't afraid of running brandnew code This document describes how to build from source
- Note If you wish to contribute to the project you need to install the latest development version

751 Installing nightly builds

The continuous integration servers of the scikitlearn project build test and upload wheel packages for the most recent Python version on a nightly basis to help users test bleeding edge features or bug fixes

pip install pre f httpssklearnnightlyscdn8secureraxcdncom scikitlearn

752 Building from source

In the vast majority of cases building scikitlearn for development purposes can be done with

pip install cython pytest flake8

Then in the main repository

pip install editable

Please read below for details and more advanced instructions

Dependencies

Scikitlearn requires

- Python 35
- NumPy 111
- SciPy 017
- Joblib 011

Note For installing on PyPy PyPy3v510 Numpy 1140 and scipy 110 are required For PyPy only installa

tion instructions with pip apply

Building Scikitlearn also requires

- Cython 0285

75 Advanced installation instructions 2443

scikitlearn user guide Release 0213

- OpenMP

Note It is possible to build scikitlearn without OpenMP support by setting the SKLEARNNOOPENMP environment variable before cythonization This is not recommended since it will force some estimators to run in sequential mode and their njobs parameter will be ignored

Running tests requires

- pytest 330

Some tests also require pandas

Retrieving the latest code

We use Git for version control and GitHub for hosting our main repository

You can check out the latest sources with the command

`git clone gitgithubcomscikitlearnscikitlearngit`

If you want to build a stable version you can `git checkout VERSION` to get the code for that particular

version or download a zip archive of the version from github

Once you have all the build requirements installed see below for details you can build and install the package in the following way

If you run the development version it is cumbersome to reinstall the package each time you update the sources

Therefore it's recommended that you install in editable mode which allows you to edit the code inplace This builds the extension in place and creates a link to the development directory see the pip docs

`pip install editable`

Note This is fundamentally similar to using the command `python setup.py develop` see the `setuptools`

docs It is however preferred to use pip

Note You will have to rerun

`pip install editable`

every time the source code of a compiled extension is changed for instance when switching branches or pulling changes from upstream Compiled extensions are Cython files ending in `.pyx` or `.pxd`

On Unixlike systems you can equivalently type `make` in from the `toplevel` folder Have a look at the `Makefile` for additional utilities

Mac OSX

The default C compiler `AppleClang` on Mac OSX does not directly support OpenMP The first solution to build scikitlearn is to install another C compiler such as `gcc` or `llvmclang` Another solution is to enable OpenMP support on the default `AppleClang` In the following we present how to configure this second option

You first need to install the OpenMP library

2444 Chapter 7 Developer's Guide

scikitlearn user guide Release 0213

brew install libomp

Then you need to set the following environment variables

export CCusrbinclang

export CXXusrbinclang

export CPPFLAGSCPPFLAGS Xpreprocessor fopenmp

export CFLAGSCFLAGS lusrlocaloptlibompinclude

export CXXFLAGSCXXFLAGS lusrlocaloptlibompinclude

export LDFLAGSLDFLAGS Lusrlocaloptlibomplib lomp

export DYLDLIBRARYPATHHusrlocaloptlibomplib

Finally you can build the package using the standard command

FreeBSD

The clang compiler included in FreeBSD 120 and 112 base systems does not include OpenMP support You need to

install theopenmp library from packages or ports

sudo pkg install openmp

This will install header files in usrlocalinclude and libs inusrlocallib Since these directories are

not searched by default you can set the environment variables to these locations

export CFLAGSCFLAGS lusrlocalinclude

export CXXFLAGSCXXFLAGS lusrlocalinclude

export LDFLAGSLDFLAGS Lusrlocallib lomp

export DYLDLIBRARYPATHHusrlocallib

Finally you can build the package using the standard command

For the upcoming FreeBSD 121 and 113 versions OpenMP will be included in the base system and these steps

will not be necessary

753 Installing build dependencies

Linux

Installing from source without conda requires you to have installed the scikitlearn runtime dependencies Python

development headers and a working CC compiler Under Debianbased operating systems which include Ubuntu

sudo aptget install buillessential python3dev python3setuptools

python3pip

and then

pip3 install numpy scipy cython

Note In order to build the documentation and run the example code contains in this documentation you will need

matplotlib

pip3 install matplotlib

75 Advanced installation instructions 2445

scikitlearn user guide Release 0213

When precompiled wheels are not available for your architecture you can install the system versions

sudo apt-get install cython3 python3numpy python3scipy python3matplotlib

On Red Hat and clones eg CentOS install the dependencies using

sudo yum -y install gcc gcc python-devel numpy scipy

Note To use a high performance BLAS library eg OpenBlas see scipy installation instructions

Windows

To build scikitlearn on Windows you need a working C compiler in addition to numpy scipy and setuptools

The building command depends on the architecture of the Python interpreter 32bit or 64bit You can check the architecture by running the following in cmd or powershell console

python -c import struct; print(struct.calcsize('P') \* 8)

The above commands assume that you have the Python installation folder in your PATH environment variable

You will need Build Tools for Visual Studio 2017

For 64bit Python configure the build environment with

SET DISTUTILS\_USE\_SDK=1

CPROGRAMFILES=x86\_Microsoft Visual

Studio 2017 Build Tools VC Auxiliary Build\vcvarsall.bat x64

And build scikitlearn from this environment

python setup.py install

Replace x64 by x86 to build for 32bit Python

Building binary packages and installers

The wheel package and exe installers can be built with

pip install wheel

python setup.py bdist\_wheel bdist\_wininst bdist\_logos scikitlearn\_logos

The resulting packages are generated in the dist folder

Using an alternative compiler

It is possible to use MinGW a port of GCC to Windows OS as an alternative to MSVC for 32bit Python Not that extensions built with mingw32 can be redistributed as reusable packages as they depend on GCC runtime libraries typically not installed on end users environment

To force the use of a particular compiler pass the compiler flag to the build step

2446 Chapter 7 Developer's Guide

scikitlearn user guide Release 0213

python setup.py build compilermycompiler install  
where mycompiler should be one of mingw32 or msvc  
76 Maintainer coredeveloper information

761 Before a release

1 Update authors table

cd buildtools make authors cd  
and commit

2 Confirm any blockers tagged for the milestone are resolved and that other issues tagged for the milestone can be postponed

3 Ensure the change log and commits correspond within reason and that the change log is reasonably well curated Some tools for these tasks include

- mainttoolssortwhatsnew.py can put what's new entries into sections
- Themainttoolswhatmissingsh script may be used to identify pull requests that were merged but likely missing from What's New

Preparing a bugfix release

Since any commits to a released branch eg 0999X will automatically update the web site documentation it is best to develop a bugfix release with a pull request in which 0999X is the base It also allows you to keep track of any tasks towards release with a TO DO list

Most development of the bug fix release and its documentation should happen in master to avoid asynchrony To select commits from master for use in the bug fix version 09993 you can use

git checkout b release09993 master

git rebase i 0999X

Then pick the commits for release and resolve any issues and create a pull request with 0999X as base Add a commit updating sklearn version Additional commits can be cherry picked into the release0

9993 branch while preparing the release

762 Making a release

1 Update docs

- Edit the docwhatsnewrst file to add release title and commit statistics You can retrieve commit statistics with

git shortlog s 09933 cut f2 sort ignorecase tr n

↵sed s gs

- Update the release date in whatsnewrst
- Edit the docindexrst to change the 'News' entry of the front page

76 Maintainer coredeveloper information 2447

scikitlearn user guide Release 0.21.3

- Note that these changes should be made in master and cherry-picked into the release branch
- 2 On the branch for releasing update the version number in sklearn\_init.py the version variable by removing dev only when ready to release On master increment the version in the same place when branching for release

3 Create the tag and push it

```
git tag a.0.999
git push git@github.com:scikitlearn/scikitlearn.git tags
```

4 Create the source tarball

- Wipe clean your repo
- ```
git clean -x -f
```
- Generate the tarball
- ```
python setup.py sdist
```

The result should be in the dist folder We will upload it later with the wheels Check that you can install it in a new virtualenv and that the tests pass

5 Update the dependency versions and set BUILD\_COMMIT variable to the release tag at

<https://github.com/MacPythons/scikitlearnwheels>

Once the CI has completed successfully collect the generated binary wheel packages and upload them to PyPI by running the following commands in the scikitlearn source folder checked out at the release tag

```
pip install U wheelhouseuploader twine
python setup.py fetchartifacts
```

6 Check the content of the dist folder it should contain all the wheels along with the source tarball "scikit-learn-XXX.tar.gz"

Make sure that you do not have developer versions or older versions of the scikitlearn package in that folder

Upload everything at once to <https://pypi.org>

```
twine upload dist
```

7 For major/minor not bugfix release update the symlink for stable in <https://github.com/scikitlearn/scikitlearn.github.io>

```
cd tmp
git clone --depth 1 --no-checkout git@github.com:scikitlearn/scikitlearn
cd scikitlearn.github.io
echo stable gitinfo: sparse-checkout
git checkout master
ln -sf 0.999 stable
git push origin master
```

The following GitHub checklist might be helpful in a release PR

- update news and what's new date in master and release branch
- create tag
- update dependencies and release tag at <https://github.com/MacPythons/scikitlearnwheels>

scikitlearn user guide Release 0213

763 The scikitlearnorg web site

The scikitlearn web site httpscikitlearnorg is hosted at GitHub but should rarely be updated manually by pushing to the httpsgithubcomscikitlearnscikitlearngithubio repository Most updates can be made by pushing to master for dev or a release branch like 099X from which Circle CI builds and uploads the documentation automatically

764 Travis Cron jobs

From httpsdocstraviscicomusercronjobs Travis CI cron jobs work similarly to the cron utility they run builds at regular scheduled intervals independently of whether any commits were pushed to the repository Cron jobs always fetch the most recent commit on a particular branch and build the project at that state Cron jobs can run daily weekly or monthly which in practice means up to an hour after the selected time span and you cannot set them to run at a specific time

For scikitlearn Cron jobs are used for builds that we do not want to run in each PR As an example the build with the dev versions of numpy and scipy is run as a Cron job Most of the time when this numpydev build fail it is related to a numpy change and not a scikitlearn one so it would not make sense to blame the PR author for the Travis failure The definition of what gets run in the Cron job is done in the travisyaml config file exactly the same way as the other Travis jobs We use a if type cron filter in order for the build to be run only in Cron jobs

The branch targeted by the Cron job and the frequency of the Cron job is set via the web UI at httpswwwtravisciorgscikitlearnscikitlearnsettings

765 Experimental features

Thesklearnexperimental module was introduced in 021 and contains experimental features estimators that are subject to change without deprecation cycle

To create an experimental module you can just copy and modify the content of enablehistgradientboostingpy or enableiterativeimputerpy

Note that the public import path must be to a public subpackage like sklearnensemble orsklearnimpute not just apy module Also the private experimental features that are imported must be in a submodulesubpackage of the public subpackage eg sklearnensemblehistgradientboosting orsklearnimpute iterativepy This is needed so that pickles still work in the future when the features aren’t experimental anymore

Please also write basic tests following those in testenablehistgradientboostingpy

Make sure every userfacing code you write explicitly mentions that the feature is experimental and add a noqa comment to avoid pep8related warnings

To use this experimental feature we need to explicitly ask for it  
from sklearnexperimental import enablehistgradientboosting noqa  
from sklearnensemble import HistGradientBoostingRegressor

76 Maintainer coredeveloper information 2449

scikitlearn user guide Release 0.21.3

For the docs to render properly please also import enablemyexperimentalfeature into conf.py  
else sphinx won't be able to import the corresponding modules Note that using from sklearn.experimental  
import does not work

Note that some experimental classes / functions are not included in the sklearn.experimental module  
sklearn.datasets.fetch\_openml
